

## Managed File Transfer

### Secure File Sharing For Businesses

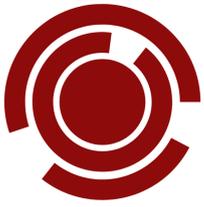

When people think of ad-hoc file sharing, the first option that often comes to mind is Dropbox. A quick Google search recommends Dropbox as a viable solution to a team's file-sharing requirements, and if you already use it for your personal documents or have seen it in action while collaborating on side projects, you might think the popular file service's "Dropbox Business" tiers are an obvious shoe-in.

But what if there is a better and more effective solution out there, one that is made specifically for business and industry file transfer and file sharing needs?

### Hassle-Free File Transfer

**Managed File Transfer** – commonly known as MFT – is a secure file transfer software that simplifies, streamlines, and secures the files you exchange with your team, employees, customers, trading partners and third-party vendors. For MFT, the goal isn't just to safely transfer files via industry protocols (e.g. SFTP, FTPS, HTTPS). It is also to give organisations a way to automate their file transfer workflows, track and audit activity and furthermore internally collaborate on mission-critical projects through a single, centralised interface. Managed file transfer software offers organisations a lot more value than file transfers and collaboration.

If your considerations include **compliance** (e.g. FISMA, **HIPAA**, **PCI DSS**, or the GDPR), workflow automation, or full audit logs, or if your business exchange a high volume of file transfers a day then MFT can help simplify your processes, reduce manual work, secure your files inside and outside of your private network.

## MFT - Designed For You

**Freedomtech Solutions' MFT** is a managed file transfer solution that automates and secures file transfers using a centralised enterprise-level approach. Incorporating MFT software will save you time and money, improve **security**, simplify **server-to-server file transfers** and further help your organisation to meet compliance requirements. Protecting sensitive data is of paramount importance in today's environment.

Freedomtech's secure MFT solution will provide a safe, audited method for automatically transferring information within and outside of your enterprise. For ultimate flexibility, you can deploy MFT solutions on-premises, in the cloud on platforms like Microsoft **Azure** and **AWS**, or within **hybrid environments**. Our secure managed file transfer solution runs easily on platforms like **Linux, Windows, AIX**, the **IBM** and more.

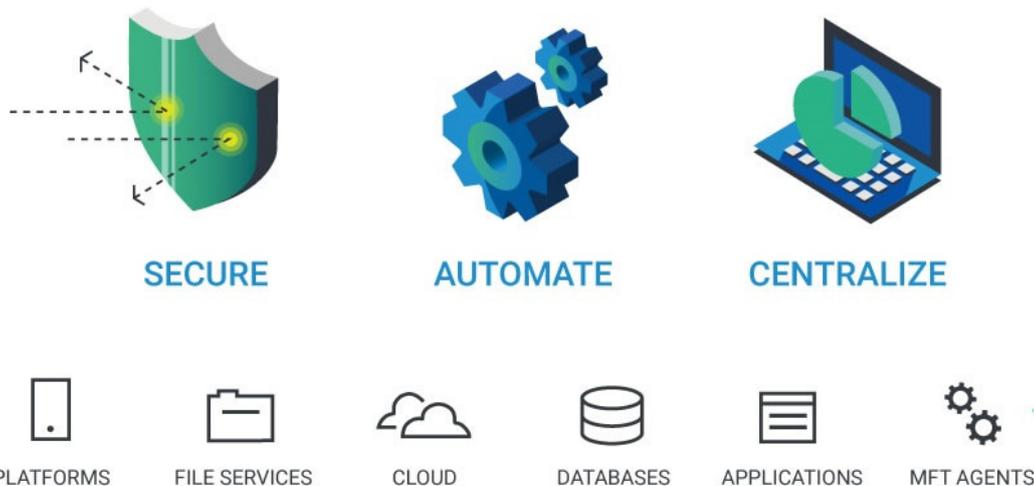

### MFT Solution Options

Our MFT solutions have a **modular set-up**, allowing you to choose which functionality you need. This includes automated workflows, high security, auditing and reporting and much more. We will design your solution based on your exact requirements, in the most cost-effective way for you. It is also scalable so that you can add functionality through additional modules as you grow.

MFT delivers automation, **world-class security** including multiple security layers, multi-factor authentication and greater visibility at your fingertips. Choose from our **high-availability** cloud-hosted service, dedicated infrastructure or opt for your own environment.

## MFT - Holistic View

### Reduce Cost & Complexity of Multi-Site Data Protection.

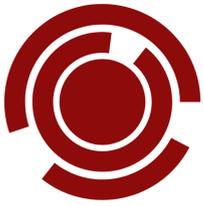

You no longer have to use multiple products and scripts to handle your secure file transfer solution processes. Freedomtech Managed File Transfer is a **comprehensive solution** that will manage your organisation's file transfer software, file sharing, secure FTP and automation needs through a single interface.

Freedomtech's MFT software has the flexibility to simplify, secure and audit:

- Batch server-to-server file transfers
- User-to-system ad-hoc file transfers
- Person-to-Person file collaboration

Managed File Transfer technology will unify the data flow through all systems, meaning there will be fewer manual data entry points. Human intervention increases the risk of errors, so your information stays clean. Less time is spent on manual processing and you have a complete picture of all interactions so you that can deliver an informed and personalised customer service.

SLA monitoring functions notify you if a transfer fails, so you can rectify it before you have breached an SLA. The additional stringent security controls mean you are meeting compliance requirements and customers can be confident they are doing business with an organisation that protects their data.

## MFT - Holistic View

Your **return on investment** will depend on the unique set of circumstances in your organisation and how far along you are in your digital transformation journey.

For example, a large organisation will have many more processes that could be automated when compared to a small one.

A good estimate is to calculate the **number of hours** spent each year on the manual processes and **multiply** that figure by **the average hourly staff cost**.

Some of the cost savings to consider include:

- Automating manual processes involving data, such as data re-entry into other systems, or moving files to a new location or team.
- Time spent by technical experts maintaining homegrown scripts and legacy systems.
- The risk of a data breach is greatly reduced, along with the associated costs from fine and reputational damage.

**Freedomtech Solutions' cloud MFT service** helps your business save money on infrastructure, whilst offering the highly available, responsive, scalable and accessible benefits of the cloud.

Combined with our managed service, you will also have access to unrivalled expertise to manage this whole area of your infrastructure. **Free up your time, save money** and get your business running as **efficiently** as possible.

If you don't already have an MFT solution in place or are using legacy PC tools, scripts or FTP to transfer files, then an affordable MFT solution will help you solve multiple requirements at once.
