

Ormus Chemtrails as a Global Warming Solution:

Jeremy VanHaitsma

Global warming is one of the greatest challenges facing modern man as the CO₂ emissions generated by humans are setting off climate change with devastating consequences. This off the wall idea suggests how several suppressed technologies and one conspiracy theory, assuming all have truth inherent within them, could synergistically solve the Global warming problem. The conspiracy theory in question has to do with the so called “chemtrail” phenomenon, and the suppressed technologies to be utilized would involve ormus and also water fuel cell technology.

Let me first address the chemtrail phenomenon in brief. Supposedly there is evidence to suggest that our government or governments of the world have been engaged in some sort of global campaign to spray chemical trails over the landmass of earth, especially population dense area, for what reason god only knows. The trails are said to resemble contrails emitted by airplanes but have differing characteristics that differentiate them such as they linger for an extended period of time. Some conspiracy theorists have supposedly collected samples of the chemtrail sprayings and have alleged that they contain combinations of biological agents mixed with desiccated red blood cells and pathogens and that there is some sort of diabolical plot being perpetrated by the “secret government” to reduce the world’s population. Other’s have suggested that it is an attempt to reduce global warming by spraying reflective metallic particulates into the atmosphere to reflect the sun’s rays back into space and help cool the planet. Apparently their have also been patents issued to support this particular application of the chemtrail phenomenon.

In regards to the chemtrail phenomenon at least in the realm of wild conspiracy theorists on the internet there has been some evidence amassed that would point towards something that is taking place. Photographs of planes with emitters spraying something out the back of the wings, criss cross patterns of aerial sprayings that supposedly mainly take place at night, witness reports and other observations. Anyway, for the sake of this document let us assume that yes the chemtrail phenomenon is real to some degree. Maybe we will never really know to what end. Be it to reflect the sun’s rays back into space or to reduce the population or who knows what else. But if the infrastructure and the systems were in place to conduct these types of aerial sprayings then that could be utilized to end global warming rather quickly.

Ormus or orbitally rearranged monatomic elements of the platinum group metals. Ormus is a strange phase of matter that occurs in nature. Discovered by David Hudson through

painstaking analysis of the soil samples of his ranch in Arizona it also occurs in the air and in sea salt, sea water, well water and can be extracted through various means. Some of these means include the wet method for extracting it from sea water by “swinging the ph” with lye, or from well water by building a magnetic vortex water trap, or via other methods. You can even synthesize the material from the platinum group metals themselves.

So what does ormus and chemtrails have to do with ending global warming? Ormus can make plants growth super fast and super big! Unfortunately ormus degrades with ultraviolet light so it would have to be sprayed at night but that’s ok since chemtrails are usually applied at night any way. A company called sea crop already sells a liquid ormus product that I would guess is made using this cheap wet method technique. So basically you make lots of ormus from sea water, fill the chemtrail planes with it and spray it over all of the land mass of the earth. The plants grow really big really fast and they sequester lots and lots of CO2. But airplanes are not very green because they emit CO2 also. That’s where the water fuel cell technology comes into play.

The water fuel cell technology has by introduced by dozens of companies and inventors over the years and has repeatedly been suppressed time and time again. It involved using a unique type of pulsed dc signal to cause water to disassociate into hydrogen and oxygen similar to electrolysis. Stanley Meyer had far reaching patents discussing how water fuel cells could be outfitted not only to power the internal combustion engines of automobiles but also to run the jet engines of airplanes, and also to power furnaces for heat and generators for electricity etcetera. But all of the chemtrail planes could be outfitted with water fuel cells to make them carbon neutral. And they would not use any fossil fuels, only water so they would be a lot cheaper to operate.

A variation on Stan Meyer’s water fuel cell technology was introduced by his surviving brother Steve Meyer’s. Only his variation was/is to be applied for use in water desalination and purification. Since sea water contains the ormus then Stephen meyer’s cell could help obtain from the seawater then after his water fuel cell type device desalinates the sea water the brine leftover could be used for ormus production via the wet method.

In conclusion I know that all of these ideas are not fully validated by the mainstream and are kind of fringy and crackpot. But if true and if combined in such a way I believe that they could have the implications of helping to reduce global warming through carbon sequestration. If you search on the internet for ormus plants and ormus picture book you are able to see the results that other people have obtained from plants treated with ormus. Or you could try a simple experiment yourself to demonstrate the effects of ormus on plant growth. From a mother plant take two identical clones. Grow each clone in an identical environment and treat one with ormus and the other without. The ormus plants should grow a lot bigger and

healthier with more vigorous growth. So if that aspect works then let us move to the next aspect, the delivery system of the ormus to the plants of earth. Can a water fuel cell be used to power an airplane? Here are some other questions you may want to ask:

1. What is ormus?
2. Can ormus make plants grow a lot bigger and faster and why?
3. Can ormus be made from sea water and/or sea salt, rock salt, and be made en masse on the cheap?
4. Can a water fuel cell power a plane and could a plane be used to spray ormus solution over large swathes of land mass over night?
5. How would this affect the growth of jungles and forests and the amount of carbon dioxide that the plants would sequester?
6. Do paramagnetic soils affect the health of forests and could this be related to the presence of ORME's in the soil?
7. What if you utilized ORME's to grow cannabis for fiber production, perhaps to produce stock to produce cellulosic ethanol or to grow algae for biodiesel production?
8. With water fuel cell technology would biofuels even be necessary?
9. If these technologies have been made to work once then can they be made to work again?
10. What's stopping mankind from using these technologies to solve the problems facing us today?

Another experiment that could test if my theory is correct would be to grow two 1 acre plots of crops. One of them spray aerially at night with water and the other with water and ormus solution mixture. Then weigh the crops of the plants after harvesting them to gauge the results. Then try to convert the crop duster used to run off of a water fuel cell, or geet hybrid or something carbon neutral... Happy experimenting
