

***Endangers Human Health,
Environment & Democracy***

5G Mass Action Campaign

Governments and telecom companies around the world are pushing for a rollout of 5G technology adding to our current technology, despite the fact that it comes with greater health risks, excessive financial costs, complete invasion of privacy and the ability to be utilized as a sophisticated weapon.

Health

Substantial evidence and scientific studies exist to prove that 5G millimetre waves are dangerous to humans and our environment as well as to birds and bees.

Those most at risk include the unborn, children, the infirm, the elderly and the disabled.

5G Millimetre waves affect the eyes, skin and testes. Published studies show that current wireless exposure already causes cancers, alters brain development and contributes to many of our health problems.

Living near phone masts causes headaches, memory problems, dizziness, depression and sleep problems as well as life threatening cancers yet Govt's are preparing to install small cell towers and wireless facilities everywhere, including on streetlights and utility poles as well as covering the whole of the country with small cell towers between

100 to 300 metres apart and directly in front of our homes.

Radiation is cumulative so over a period of time, the health of the nation will deteriorate adding to our current wireless technology and bringing yet another layer of radiation to our environment, using higher frequencies and dangerous millimetre waves.

The dangers of 5G to our health has prompted 246 Doctors and Scientists from 42 countries to call for a Moratorium yet Govt's are ignoring any studies that show risks in favour of Industry led research.

It will not be the first time that Govt's have pushed highly dangerous substances our way only to discover the health risks later on, think Asbestos, DDT, Lead paint etc. which is why Lloyds has refused to insure against health problems stemming from 5G technology.

Costs

The costs of this technology will be passed onto the consumer as plans to connect everything we own such as domestic appliances is connected to the Internet, for which they coin the phrase the Internet of things.

Invasion of Privacy

No surprise that the CIA has funded many companies that produce software and hardware via its venture capital company,

In-Q-tel. In a recent 'Panorama' programme, Fiona Philips demonstrated how the 'smart' system can easily be hacked. Where baby alarms and security cameras can be watched 'remotely' by unknown third parties.

5G millimeter waves have been used as a military weapon for many years in many countries using such things as brain hacking techniques, even the Winter Olympics which was held in 2018 showcased using 5G technology by reportedly shooting rays and creating sounds to disturb the wild boars.

Ofcom began the process of selling off the spectrum for 5G during 2018 and expect to complete by 2020. We need to do what many regions have done and invest in safer and smarter fibre optic cabling all the way to each home, rather than antennas in front yards. Wired fibre optic connections are safer, faster, more reliable, provide greater capacity, and are more cyber secure; And as wireless expert and ex director of Ofcom, Professor William Webb states, 5G is no guarantee of better connectivity or faster speeds. What can we do?
