# Bayesian Checks on Cheating on Tests 

Wim J. van der Linden
Charles Lewis

## Outline

- Interpretation problems $\boxtimes$
- Bayesian checks $\boxtimes$
- Empirical examples $\square$
- Discussion $\boxtimes$

## Interpretation Problems

- Current statistical checks based on the idea of hypothesis testing
- $\mathrm{H}_{0}$ and $\mathrm{H}_{1}$ often implicit
- Null and alternative distributions seldom specified
- Choice of significance level arbitrary
- These tests have been successful only because of the omnipresence of cheating
- Any "test" that orders a population w.r.t. a relevant statistic would have been!

## Interpretation Problems

- Schools don't understand hypothesis testing
- Tradeoff between Type 1 and II errors
- Significant $\neq$ true
- How to account for a known proportion of the population that actually cheats?
- Statistical tests at different levels
- Students, classes, schools
- Results may seem inconsistent (statistically they are not!)

## Interpretation Problems

- Should we condition? If so, how?
- K-index: incorrect responses by s
- Generalized binomial test: none of the responses by $s$
- Conditional version of same test: all of responses by $s \square$
- Expected power of conditional test is equal to power of unconditional test (Lehmann \& Romano, 2005, chap. 10)

## Interpretation Problems Cont'd

- Only nonstatistical reasons to choose an unconditional test over a conditional one, e.g.,
- repetitive use of test
- symmetry
- computational reasons

## Bayesian Checks

- Bayesian approach
- Posterior odds of cheating easier to interpret than significance probabilities
- Automatic allows for known proportion that actually cheats (prior probabilities)
- Conditioning on all responses, both by the source and the copier $\square$

## Bayesian Checks Cont'd

- Checks should only be used if there is prior evidence suggesting scrutiny of a specific portion of the test, e.g., a section in the test or page of the answer sheet
- Blind applications to the complete tests for all pairs of test takers are meaningless
- Example for check on answer copying
- For other types of cheating, see full paper

## Bayesian Checks Cont’d

- Notation
- c: hypothetical copier
- $s$ : source
- M: set of all items with matching (correct or incorrect) responses
$-\Gamma \subseteq M$ : (unknown) subset of $M$ actually copied
$-\Gamma=\varnothing$ : no copying
$-p(\Gamma)$ : prior probability of subset $\Gamma$ being copied (defined over all possible subsets of $M$ )

## Bayesian Checks Cont'd

## Bayesian Checks Cont'd

- Response probability for copier on item $i$

$$
p\left(y_{c i} \mid \theta_{c}, \Gamma, y_{s i}\right)=\left\{\begin{array}{cll}
p\left(y_{c i} \mid \theta_{c}\right), & \text { if } i \notin \Gamma \\
1, & \text { if } i \in \Gamma, & y_{c i}=y_{s i} \\
0, & \text { if } i \in \Gamma, & y_{c i} \neq y_{s i}
\end{array}\right.
$$

- Probability of response vectors $\mathbf{y}_{c}$ and $\mathbf{y}_{s}$

$$
\begin{aligned}
p\left(\mathbf{y}_{c}, \mathbf{y}_{s} \mid \theta_{c}, \theta_{s}, \Gamma\right) & =p\left(\mathbf{y}_{c} \mid \theta_{c}, \Gamma, \mathbf{y}_{s}\right) p\left(\mathbf{y}_{s} \mid \theta_{s}\right) \\
& =\prod_{i=1}^{n} p\left(y_{c i} \mid \theta_{c}, \Gamma, y_{s i}\right) \prod_{i=1}^{n} p\left(y_{s i} \mid \theta_{s}\right)
\end{aligned}
$$

## Bayesian Checks Cont'd

- Response probability for copier on item $i$

$$
p\left(y_{c i} \mid \theta_{c}, \Gamma, y_{s i}\right)=\left\{\begin{array}{cll}
p\left(y_{c i} \mid \theta_{c}\right), & \text { if } i \notin \Gamma & \\
1, & \text { if } i \in \Gamma, & y_{c i}=y_{s i} \\
0, & \text { if } i \in \Gamma, & y_{c i} \neq y_{s i} \\
\hline
\end{array}\right.
$$

- Probability of response vectors $\mathbf{y}_{c}$ and $\mathbf{y}_{s}$

$$
\begin{aligned}
p\left(\mathbf{y}_{c}, \mathbf{y}_{s} \mid \theta_{c}, \theta_{s}, \Gamma\right) & =p\left(\mathbf{y}_{c} \mid \theta_{c}, \Gamma, \mathbf{y}_{s}\right) p\left(\mathbf{y}_{s} \mid \theta_{s}\right) \\
& =\prod_{i=1}^{n} p\left(y_{c i} \mid \theta_{c}, \Gamma, y_{s i}\right) \prod_{i=1}^{n} p\left(y_{s i} \mid \theta_{s}\right)
\end{aligned}
$$

## Bayesian Checks Cont'd

- Posterior probability of $\Gamma=\varnothing$ (i.e., no copying)

$$
\begin{aligned}
& =\frac{p(\varnothing) \prod_{i=1}^{n} p\left(y_{c i} \mid \theta_{c}, \Gamma, y_{s i}\right) \prod_{i=1}^{n} p\left(y_{s i} \mid \theta_{s}\right)}{\sum_{\Gamma} p(\Gamma) \prod_{i=1}^{n} p\left(y_{c i} \mid \theta_{c}, \Gamma, y_{s i}\right) \prod_{i=1}^{n} p\left(y_{s i} \mid \theta_{s}\right)} \\
& =\frac{p(\varnothing) \prod_{i=1}^{n} p\left(y_{c i} \mid \theta_{c}, \Gamma, y_{s i}\right)}{\sum_{\Gamma} p(\Gamma) \prod_{i=1}^{n} p\left(y_{c i} \mid \theta_{c}, \Gamma, y_{s i}\right)}
\end{aligned}
$$

## Bayesian Checks Cont'd

- Posterior probability of $\Gamma=\varnothing$ (cont'd)

$$
\begin{aligned}
p\left(\varnothing \mid \mathbf{y}_{c}, \mathbf{y}_{s}\right) & =\frac{p(\varnothing) \prod_{i \in M} p\left(y_{c i} \mid \theta_{c}\right) \prod_{i=M} p\left(y_{c i} \mid \theta_{c}\right)}{\sum_{\Gamma \subseteq M} p(\Gamma) \prod_{i \in M} p\left(y_{c} \mid \theta_{c}, \Gamma, y_{s i}\right) \prod_{i \in M} p\left(y_{c i} \mid \theta_{c}\right)} \\
& =\frac{p(\varnothing) \prod_{i \in M} p\left(y_{c i} \mid \theta_{c}\right)}{\sum_{\Gamma \subseteq M} p(\Gamma) \prod_{i \in M} p\left(y_{c i} \mid \theta_{c}, \Gamma, y_{s i}\right)}
\end{aligned}
$$

## Bayesian Checks Cont'd

- Posterior odds of cheating can be shown to simplify to

$$
\frac{1-p\left(\varnothing \mid \mathbf{y}_{c}, \mathbf{y}_{s}\right)}{p\left(\varnothing \mid \mathbf{y}_{c}, \mathbf{y}_{s}\right)}=\frac{\sum_{\Gamma \neq \varnothing}^{\Gamma \in M}}{} p(\Gamma) \prod_{i \in M \backslash \Gamma} p\left(y_{c i} \mid \theta_{c}\right)
$$

- Thus, odds are independent of - ability of source
- any responses outside set of matches, $M$

## Bayesian Checks Cont'd

- Proposed specification of prior probabilities of cheating
- Choice of prior probability of no cheating, $p(\varnothing)$, (or odds of no cheating)
- Assumption of independence across items
- Choice of prior probabilities $\gamma_{i}$ of cheating on item $i$ to be consistent with

$$
p(\varnothing)=\prod_{i \in N}\left(1-\gamma_{i}\right)
$$

## Bayesian Checks Cont'd

- Posterior odds of cheating are now equal to

$$
\frac{1-p\left(\varnothing \mid \mathbf{y}_{c}, \mathbf{y}_{s}\right)}{p\left(\varnothing \mid \mathbf{y}_{c}, \mathbf{y}_{s}\right)}=\frac{\sum_{\substack{\Gamma \neq \infty}} \prod_{i \in \Gamma} \gamma_{i} \prod_{i \in M \backslash \Gamma}\left(1-\gamma_{i}\right) p_{c i}}{\prod_{i \in M}\left(1-\gamma_{i}\right) p_{c i}}
$$

- Complicated combinatorial expression
- Example for set of 3 items
- Notation: $\xi_{c i}=\left(1-\gamma_{i}\right) p_{c i}$ (compare with $\left.\gamma_{i} \cdot 1\right)$

## Posterior Odds for Set of 3 Items

| Items | Products of $\gamma_{i}$ and $\xi_{\mathrm{cc}}$ |  |  |
| :---: | :---: | :---: | :---: |
|  | $\gamma$ | $\xi$ | $\gamma^{\prime} \xi$ |
| $\emptyset$ | 1 | $\xi_{\mathrm{cl}} \xi_{\mathrm{c}} \xi_{\mathrm{c} 3}$ | $\xi_{\mathrm{c}} \xi_{\mathrm{c}} \xi_{\mathrm{c} 3}$ |
| $\{1\}$ | $\gamma_{1}$ | $\xi_{\mathrm{c} 2} \xi_{\mathrm{c} 3}$ | $\gamma_{1} \xi_{\mathrm{c} 2} \xi_{\mathrm{c} 3}$ |
| $\{2\}$ | $\gamma_{2}$ | $\xi_{\mathrm{c}} \xi_{\mathrm{c}}$ | $\xi_{\mathrm{c}} \gamma_{2} \xi_{\mathrm{c} 3}$ |
| $\{3\}$ | $\gamma_{3}$ | $\xi_{\mathrm{c} 1} \xi_{\mathrm{c} 2}$ | $\xi_{\mathrm{c} 1} \xi_{\mathrm{c}} \gamma_{\mathrm{c} 3}$ |
| $\{1,2\}$ | $\gamma_{1} \gamma_{2}$ | $\xi_{\mathrm{c} 3}$ | $\gamma_{1} \gamma_{2} \xi_{\mathrm{c} 3}$ |
| $\{1,3\}$ | $\gamma_{1} \gamma_{3}$ | $\xi_{\mathrm{c} 2}$ | $\gamma_{1} \xi_{\mathrm{c}} \gamma_{3}$ |
| $\{2,3\}$ | $\gamma_{2} \gamma_{3}$ | $\xi_{\mathrm{c} 1}$ | $\xi_{\mathrm{cc}} \gamma_{2} \gamma_{3}$ |
| $\{1,2,3\}$ | $\gamma_{1} \gamma_{2} \gamma_{3}$ | 1 | $\gamma_{1} \gamma_{2} \gamma_{3}$ |$]$ Denominator

## Bayesian Checks Cont'd

- Odds can be calculated using modified version of well-known algorithm for calculation of number-correct score distributions ("Lord-Wingersky algorithm")
- Treat $\xi_{c i}$ as probability of correct response on $i$
- Treat $\gamma_{i}$ as probability of incorrect response on $i$ (They are no probabilities, though!)

## Empirical Examples

- NRM parameters for 40-item test with 5 answer choices on each item (Wollack, 1997)
- Suppose a proctor has witnessed supicious communication between $c$ and $s$ during first section of 10 items)
- Prior probability of cheating on at least one item: $1-p(\varnothing)=.25, .50$, and .75
- That is, odds of cheating equal to $1: 3,1: 1$, and $3: 1$

## Empirical Examples

- No prior knowledge as to which items in section were involved: $\gamma=1-[1-p(\varnothing)]^{-10}$
- Four pairs of abilities:
$-\theta_{c}=-2.0,-1.5,-1.0$, and -0.5
$-\theta_{s}=1.0$
- Answer copying simulated by replacing copier's responses by those by source in the data file

## Distribution of Number of Random Matches on Entire Test

## Posterior Odds for Different Cases

| $\left(\boldsymbol{\theta}_{\boldsymbol{c}} \boldsymbol{\theta}_{\mathrm{s}}\right)$ | $(-2.0,1.0)$ |  |  | $(-1.5,1.0)$ |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Prior <br> Odds | $1: 3$ | $1: 1$ | $3: 1$ | $1: 3$ | $1: 1$ | $3: 1$ |
| No. of <br> Matches |  |  |  |  |  |  |
| 2 | 0.62 | 1.71 | 4.28 | 0.31 | 0.82 | 1.98 |
| 3 | 2.04 | 7.56 | 27.58 | 0.41 | 1.18 | 3.18 |
| 4 | 2.42 | 10.51 | 45.50 | 0.76 | 2.52 | 8.50 |
| 5 | 3.15 | 16.00 | 444.05 | 0.90 | 3.20 | 12.31 |
| 6 | 6.06 | 45.44 | 681.63 | 1.62 | 7.11 | 38.02 |
| 7 | 6.82 | 57.40 | $*$ | 4.48 | 28.91 | 255.20 |
| 8 | 13.96 | 188.98 | $*$ | 5.12 | 37.47 | 407.13 |
| 9 | 15.59 | 239.49 | $*$ | 12.89 | 157.66 | $*$ |
| 10 | 19.85 | 391.38 | $*$ | 15.11 | 219.86 | $*$ |

## Posterior Odds for Different Cases

| $\left(\boldsymbol{\theta}_{\boldsymbol{c}}, \boldsymbol{\theta}_{\mathbf{s}}\right)$ | $(-1.0,1.0)$ |  |  | $(-\mathbf{0 . 5 , 1 . 0 )}$ |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Prior <br> Odds | $1: 3$ | $1: 1$ | $3: 1$ | $1: 3$ | $1: 1$ | $3: 1$ |
| No. of <br> Matches |  |  |  |  |  |  |
| 2 | 0.19 | 0.50 | 1.15 | 0.12 | 0.31 | 0.69 |
| 3 | 0.67 | 1.99 | 5.56 | 0.20 | 0.53 | 1.27 |
| 4 | 0.98 | 3.36 | 11.78 | 0.34 | 0.98 | 2.65 |
| 5 | 1.14 | 4.18 | 16.82 | 0.47 | 1.43 | 4.38 |
| 6 | 1.38 | 5.65 | 27.56 | 0.63 | 2011 | 7.50 |
| 7 | 1.63 | 7.36 | 42.35 | 0.75 | 2.65 | 10.55 |
| 8 | 8.97 | 64.74 | 658.47 | 0.85 | 3.18 | 14.02 |
| 9 | 9.56 | 74.34 | 858.08 | 0.94 | 3.68 | 17.70 |
| 10 | 11.10 | 101.38 | $*$ | 1.12 | 4.72 | 26.35 |

## Discussion

- Posterior odds
- increase with number of matches
- increase with prior odds,
- but decrease with difference between $\theta_{c}$ and $\theta_{s}$
- Posterior odds are strongly data dependent
- Same number of matches but on different items and/or alternatives leads to different odds

## Discussion Cont'd

- Two examples in which we ignore information in the data set
- differences between items
- alternatives chosen by source $\boxtimes$
- Again, Bayesian checks are only for specific hypothesis on specific parts of the test
- More informative prior distributions
- Possible to estimate $\theta_{c}$ from remaining portion of the test

## Posterior Odds as Function of Number of Matches

Average conditional probability of random match given choice by source

## Posterior Odds as Function of Number of Matches

Average marginal
probability of random match (ignoring choices by source)
