

911 EXPLORATION CORP – EXPLORATION UPDATES

DATE: April 8th, 2023

PROPERTY: Star of the West

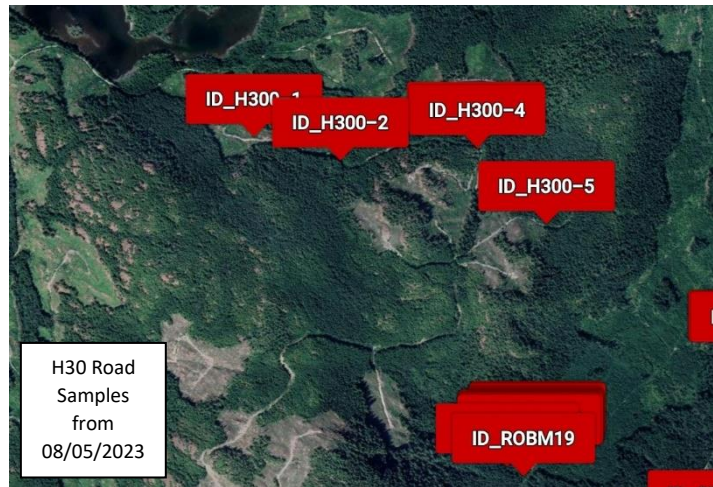

LOCATION: Zone 10, 370596N, 5437625E

COMPANY: Kermode Resources Ltd

DETAILS

On Saturday, April 8th we set out for a recon of Hawthorn Main logging road. Several branches, specifically Hawthorn Branch 300 and Hawthorn Branch 400 were the main targets. The branch roads were heavily overgrown with small trees. Additionally, we encountered over 50 fallen trees across the road. Clearing a 3km stretch of road took five hours, but we now have vehicle access to the Hawthorn minfile area.

In total we took five samples from various outcrops. All of which were from weakly mineralized shear zones, skarn or quartz veining all with under 5% sulphide content. Due to poor weather, 50mm+ rains and 50km/hr winds we stayed close to the roads for safety reasons. However, we were able to establish that a zone likely extends up the mountainside from below. Samples ROBM1 – ROBM20 were taken the day before in a 200m+ wide zone hosting many massive sulphide lenses. This mineralization is 600m away and on strike of the skarn/shears on the upper portions of Hawthorn 400 branch.

Unfortunately, we ran out of time and did not locate any of the historic Hawthorn Minfile showings this trip. Our road clearing efforts have now provided access to within 350m of the old Minfile showings and we will be undertaking detailed prospecting of the area.
