

Flag pole Mount Installation Instructions

Tools Needed:

1. Allen Wrench
2. Torx T-30
3. Socket 10 mm

1. The flag pole mount will sit into the existing gate cover holes. There is no drilling or any difficult installation procedures needed. First step is to remove the two existing bolts.

Note: There are lock nuts on the backside, be sure not to misplace these lock nuts as we will reuse them. Will not be using the bolts.

2. Using the new bolts included with the mount insert the new bolts through the bolt holes in the front and out the back of the mount. Then insert the mount with the bolts into the existing gate cover slots. **Note: Insert the top bolt first and then using the lock nuts we saved from step get the nut started on the bolt. DO NOT TIGHTEN AT THIS POINT.**

3. Now insert the lower bolt into place. **Note: you will have to put a little pressure on the mount to seat it into place.** It helps to use an allen wrench through the front hole while doing this. While the bolt is through you can get the lower nut started.

4. With both bolts and nuts started you can begin to tighten them down. Use a socket on the inside and the allen wrench on the outside. Tighten the top bolt first with a few turns, and then rotate to the bottom do not over tighten. Go back and forth until the mount is fully tightened down.
