

# HOLD ME, THRILL ME, STICK ME, CHILL ME: APPROACHES TO SPASTICITY MANAGEMENT

Donald Tower, DO

Associate Medical Director PM&R Northeast  
Rehabilitation Hospital

# DISCLOSURES

None

# OVERVIEW

- Spasticity Defined
  - Spasticity Measured
  - “Hold Me”
  - “Thrill Me”
  - “Stick Me”
  - “Chill Me”
  - Case presentation
- 

SPASTICITY...SO WHAT IS  
IT??

- ▶ 1980, Lance and colleagues defined spasticity at consensus symposium:
  - ▶ “a motor disorder characterized by a **velocity-dependent increase in tonic stretch reflexes** with exaggerated tendon jerks, resulting from hyperexcitability of the stretch reflex as one component of the *upper motor neuron syndrome*”
- ▶ 2005, Pandyan and colleagues clarified the sensorimotor issues:
  - ▶ “**disordered sensorimotor control**, resulting from and upper motor neuron lesion, presenting as intermittent or sustained *involuntary activation* of muscles.”
- ▶ 2021, Li and colleagues expounded more:
  - ▶ “manifested as **velocity- and muscle length-dependent increase in resistance** to externally imposed muscle stretch. It results from hyperexcitable descending excitatory brainstem pathways and from the resultant exaggerated stretch reflex responses. Other related motor impairments, including abnormal synergies, inappropriate muscle activation, and anomalous muscle coactivation, coexist with spasticity and share similar patho-physiological origins.”

SPASTICITY AS DEFINED BY EXPERT  
FOLKS...

A component  
of the Upper  
Motor Neuron  
Syndrome

It is a sequela  
of another  
disease  
process

KEY DEFINING CLINICAL POINTS ON  
SPASTICITY

# ETIOLOGIES OF SPASTICITY

- ▶ Stroke
  - ▶ Cerebral Palsy
  - ▶ TBI
  - ▶ ABI
  - ▶ Multiple Sclerosis
  - ▶ Traumatic and non-traumatic spinal cord injuries/non traumatic myelopathies
  - ▶ ALS
  - ▶ Primary lateral sclerosis
- 

## The Bad

- ▶ Negatively impair function
- ▶ Interfere with positioning/hygiene
- ▶ Pain and discomfort
- ▶ Increase caregiver burden

## The Good

- ▶ May facilitate gait, positioning and transfers
- ▶ Achieve developmental milestones in children (CP)
- ▶ **Key: How do we “use it”**

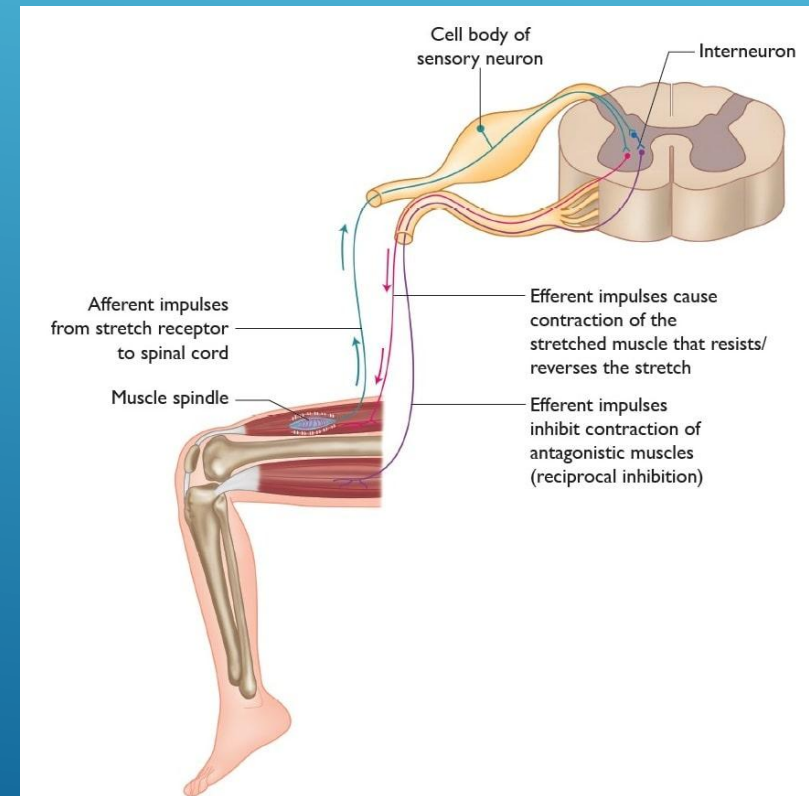

TAKE THE GOOD WITH THE BAD

- ▶ Loss of descending inhibition
- ▶ Disrupted balance excitatory and inhibitory supraspinal control
  - ▶ Hyperexcitable reflexes
- ▶ Unopposed medial cortico-reticulo-spinal tract excitability from unaffected CNS may cause “maladaptive neuroplasticity”
  - ▶ Interneurons
- ▶ Several cellular players involved.

# PATHOPHYSIOLOGY

<https://specialty.medicaldialogues.in/ultrasound-a-better-tool-than-x-ray-for-diagnosing-long-bone-fracture-study>

<https://www.handsurgeryresource.net/spasticity-upper-extremity>

# POSSIBLE BAD OUTCOMES OF SPASTICITY NOT ADDRESSED

<https://bestwoundpractice.com/trochanteric-pressure-sore-in-patient-with-advanced-ms/>

# Modified Ashworth scale

Grade	Description
0	No increase in muscle tone
1	Slight increase in muscle tone, manifested by a catch and release or by minimal resistance at the end of the range of motion (ROM) when the affected part(s) is moved in flexion or extension
1+	Slight increase in muscle tone, manifested by a catch, followed by minimal resistance throughout the remainder (less than half) of the ROM
2	More marked increase in muscle tone through most of the ROM, but affected part(s) easily moved
3	Considerable increase in muscle tone passive, passive movement difficult
4	Affected part(s) rigid in flexion or extension

<https://www.threads.com/@physioscare/post/DCRWNNAYvI>

## MEASURING SPASTICITY

**Table 3**  
Tardieu scale

### Velocities

- V1 As slow as possible, slower than the natural drop of the limb segment under gravity
- V2 Speed of limb segment falling under gravity
- V3 As fast as possible, faster than the rate of the natural drop of the limb segment under gravity

### Scoring

- 0 No resistance throughout the course of the passive movement
- 1 Slight resistance throughout the course of passive movement, no clear catch at a precise angle
- 2 Clear catch at a precise angle, interrupting the passive movement, followed by release
- 3 Fatigable clonus with less than 10 s when maintaining the pressure and appearing at the precise angle
- 4 Unfatigable clonus with more than 10 s when maintaining the pressure and appearing at a precise angle
- 5 Joint is immovable

<https://www.amazon.com/Healthy-You-Goniometer-360-Degree/dp/B07RHW1YVH>

OK, SO WE HAVE THIS  
SPASTICITY THING, NOW  
WHAT?

- ▶ Must have a valid diagnosis!
- ▶ In depth H&P with a focus on:
  - ▶ Current function and preserved neurologic
  - ▶ Care giver burden
  - ▶ Functional goals (are they in therapy?)
  - ▶ Pain, positioning and sleep
  - ▶ What's already been done
- ▶ **Remember, you are not “curing” spasticity, you are managing...so sometimes, you are just leaving it alone!!!**

## INITIAL APPROACH

BRIEF ASIDE...

“HOLD ME”

- ▶ First line treatment and adjuvant at all times
  - ▶ Cheap and available
  - ▶ Engages self management
- ▶ Optimize ROM
  - ▶ Includes finding position of ease and less stress on body
- ▶ Positioning!!!

# STRETCHING AND BRACING

A man and a woman are sitting on blue exercise mats on a light-colored wooden floor, performing a hamstring stretch. They are both leaning forward, reaching towards their feet. The woman is on the left, and the man is on the right. The background consists of large windows with a view of a cityscape. The image has a dark, semi-transparent overlay.

GETTING YOUR STRETCH  
ON....

# STRETCHING STUDIES

- ▶ Bovend'Eerdt et al. in 2008: stretching improved outcomes for persons with spasticity in 6 of 10 class 1 studies
  - ▶ Odeen et al 1981: best effect stretching at least 1 minute up to 30 minutes
  - ▶ Prescription specify intensity and degree of desired stretch, duration, repetitions and approach
- 
- A decorative graphic consisting of several parallel white lines of varying lengths, slanted diagonally from the bottom right towards the top right, located in the lower right quadrant of the slide.

- ▶ Tis what you can use when the sun goes down
- ▶ Dynamic or static
- ▶ Can be protective – ie, offload heel when supine

ORTHOTICS

A decorative graphic consisting of several parallel white lines of varying lengths, slanted upwards from left to right, located in the bottom right corner of the slide.

<https://dynamplint.com/product/wrist-forearm/>

<https://www.dme-direct.com/wheaton-pediatric-afo-ankle-foot-orthosis?srsId=AfmBOoWu8ZBRTFSXgBjjTVtqAkeQ1qA191e2ax8M4HyiTIPX8x8GqiE>

<https://nimmed.com/multipodus-boot-size-l.html>

- ▶ Literature on effectiveness of orthotics as isolated intervention for spasticity management limited
  - ▶ Some studies found no changes to bracing alone
  - ▶ Orthotics + chemodenervation shown more efficacy

## ORTHOTIC STUDIES

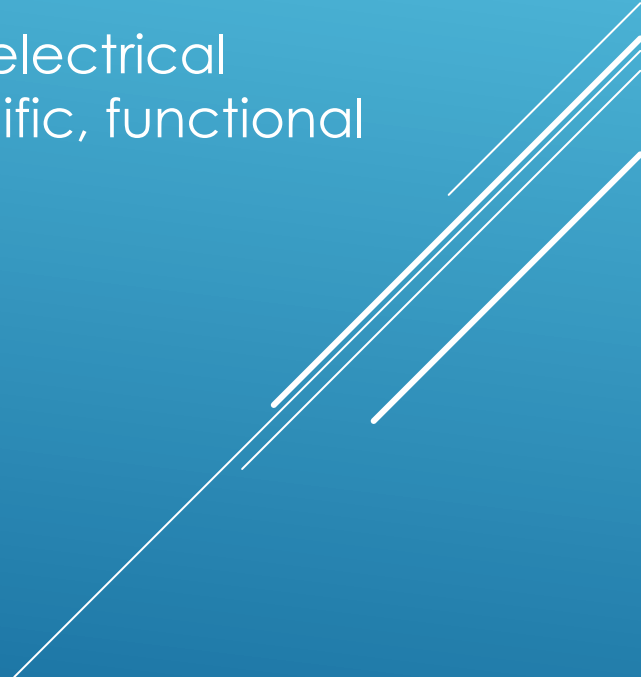

“THRILL ME”

The image features a stylized logo for "Thunderstorm". The text is rendered in a bold, blocky, 3D font. Each letter is white with a thick red outline and a red shadow on the right side, giving it a three-dimensional appearance. The letters are set against a dark, stormy background with several bright yellow lightning bolts striking down. A large, diagonal lightning bolt, colored yellow and orange, runs from the top right towards the bottom left, passing behind the text.

**THUNDERSTORM**

# NEUROMUSCULAR ELECTRICAL STIMULATION VS. FUNCTIONAL ELECTRICAL STIMULATION

- ▶ NMES: Application of electrical impulses to cause muscle contraction
  - ▶ FES: A type of NMES that uses electrical stimulation to assist with a specific, functional activity
- 

## A CLOSER LOOK...

- ▶ Bekhet et al 2019 review on NMES/FES and spasticity in SCI
  - ▶ Reduced spasticity as measured by MAS 45-60%
  - ▶ Increased ROM
  - ▶ Some results last for > 24 hours (most 1-6 hours)
- ▶ But – parameters of NMES/FES highly variable
- ▶ SCI only in this study
  - ▶ Other studies done with CVA and TBI demonstrate efficacy

<https://strokengine.ca/en/interventions/functional-electrical-stimulation-upper-extremity/>

<https://www.cambridge.org/core/books/abs/textbook-of-neural-repair-and-rehabilitation/functional-electrical-stimulation-in-neurorehabilitation/AAC2E2AD7E6B2E1892CF543F26D136E6>

<https://www.sportingwheelies.org.au/new-fes-functional-electrical-stimulation-cycle-has-arrived/>

<https://adc.bmj.com/content/97/4/364>

## Benefits

- ▶ Non-pharmacologic
- ▶ Efficacy
- ▶ Co-management of tone and adding functional tasks and gains

## Drawbacks

- ▶ **Labor intensive to set up**
- ▶ Need skilled clinicians
- ▶ Depends on intact peripheral nerves
- ▶ Contraindicated in pregnancy, implanted cardiac device, malignancy

PRACTICAL NMES/FES

A decorative graphic consisting of several parallel white lines of varying lengths and orientations, located in the bottom right corner of the slide.

- ▶ Non-invasive intervention that uses high-energy sound waves to stimulate healing in musculoskeletal tissues
- ▶ Sequence of single sound pulses that create pressure disturbance with a high pressure peak and brief duration that spreads rapidly in 3 dimensions
  - ▶ Categorized as focused extracorporeal shock wave (fESW) or radial extracorporeal shock wave (rESW)

# EXTRACORPOREAL SHOCK WAVE THERAPY

<https://www.footandanklecentersofsj.com/blog/what-is-shockwave-therapy-and-how-does-it-work-on-foot-pain>

<https://nydrehab.com/treatment-methods/shockwave/>

# FOCUSED VS. RADIAL ESWT

- ▶ ESWT used in CVA patients for pain, limb spasticity and plantar fasciitis
- ▶ Liu and Zhang in July 2025 completed Cochrane review:
  - ▶ ESWT improved spasticity, pain, motor function after CVA
  - ▶ Significant improvement ROM in LE
  - ▶ Treatment most effective with frequency less than 8 and pressure less than 2 bar
  - ▶ Released/radial ESWT associated with better outcomes
- ▶ Lee et al 2014 completed review in TBI
  - ▶ MAS improved immediately and 4 weeks after ESWT
  - ▶ Fewer patient and no clarity of type and protocols

SO WHAT HAVE THE STUDIES SHOWN?

# ADDITIONAL ESWT THOUGHTS...

- ▶ Side effects include pain, redness, swelling and bruising at treatment sites.
- ▶ Several review studies did not go into side effects in UMN patient population
  - ▶ In high cervical SCI, would there be a trigger for autonomic dysreflexia
- ▶ Application time lines (ie – immediately post injury vs. chronic) not clear at this time
- ▶ BUT, all the literature is very promising

“STICK ME”

**Botox Injection Price vs. Quality:**

**What Matters More?**

<https://dranmolchugh.com/botox-injection-price-vs-quality-what-matters-more/>

**BOTOX!!!!!!!!!!!!!!!!!!!!**

<https://www.mdpi.com/2072-6651/16/2/96>

# MECHANISM OF ACTION BOTULINUM TOXIN

- ▶ Can use it first line in focal spasticity management
  - ▶ 3 months after injury general recommendation
- ▶ Each formulation with own dosing
- ▶ FOCALIZED TREATMENTS!!!!!!
- ▶ Studies have demonstrated improvements in MAS and pain
  - ▶ Have not shown direct improvement in function
- ▶ In conjunction with other interventions

# BOTOX THE GAME CHANGER

# ASPIRE

- ▶ 2 year multicenter, prospective, observational registry of patients receiving onabotulinumtoxinA (Botox) for lower limb spasticity
  - ▶ Ongoing results being published
  - ▶ Clinician and patient satisfaction and extreme satisfaction
- ▶ Recent data ASPIRE published April PM&R 2026 by Wissel et al.
  - ▶ Pain reduction from baseline was observed across all treatments and persisted
    - ▶ Majority patients reviewed spasticity post stroke

## MORE ON BOTULINUM...

- ▶ Effects are not permanent, last usually 3 months
- ▶ Most common side effects are injection site pain, myalgia, weakness, erythema.
  - ▶ Systemic toxicity case reports rare, early usage of botulinum
  - ▶ Need to remind folks – will make you “weaker”
- ▶ May lose efficacy over time
- ▶ Strongly recommend therapies in conjunction with new botulinum toxin interventions
  - ▶ This helps with the functional gains!

- ▶ Intrathecal baclofen pump therapy
  - ▶ Bypass systemic delivery via oral dosing to limit side effects and optimize efficiency
  - ▶ Effective for **chronic** spasticity of SCI, MS, BI, CP, CVA
  - ▶ Generally considered a later/last resort
  - ▶ Complete a baclofen pump trial

PUMP IT!!!!

[amazon.com/Reebok-Mens-Pump-Omni-Sneaker/dp/B0BK34N76N](https://amazon.com/Reebok-Mens-Pump-Omni-Sneaker/dp/B0BK34N76N)

# PUMP SET UP

- ▶ Effective for global and regional spasticity management in adults and children
- ▶ More effective than oral baclofen in reducing spasm frequency
- ▶ Used in conjunction with several other interventions\*\*\*
- ▶ Risk of pump infection, pump failure
- ▶ PATIENTS MUST BE RELIABLE!!!!

## HOW DO THE PUMPS DO?

- ▶ Phenol 3-6% or ethyl alcohol 40-50% are the injectable OG's (since 1960s)
- ▶ Generally applied to motor nerves/branches to minimize sensory nerve denaturation and painful dysesthesias
  - ▶ Musculocutaneous nerve, obturator nerve, motor branch sciatic nerve to medial hamstring, radial nerve to brachioradialis
- ▶ Use Estim guidance to localize motor nerve
- ▶ Most frequently used in patients with CP
- ▶ Requires highly trained practitioner, often under sedation

LET'S TAKE A MOMENT FOR  
ALCOHOL...

“CHILL ME”

# WHAT IS CRYONEUROLYSIS

- ▶ Use of cold temperatures to cause reversible, second degree nerve injury that can treat nerve pain
- ▶ Recently trialed for spasticity
  - ▶ Ultrasound guided cryoprobe needle inserted to nerve, nerve stimulated via probe tip
  - ▶ Probe cools rapidly to -60 C or -88 C depending on cryogen boiling point, ice ball forms
  - ▶ Get Wallerian degeneration while keeping epineurium and perineurium intact
    - ▶ Allows for length dependent axonal regeneration

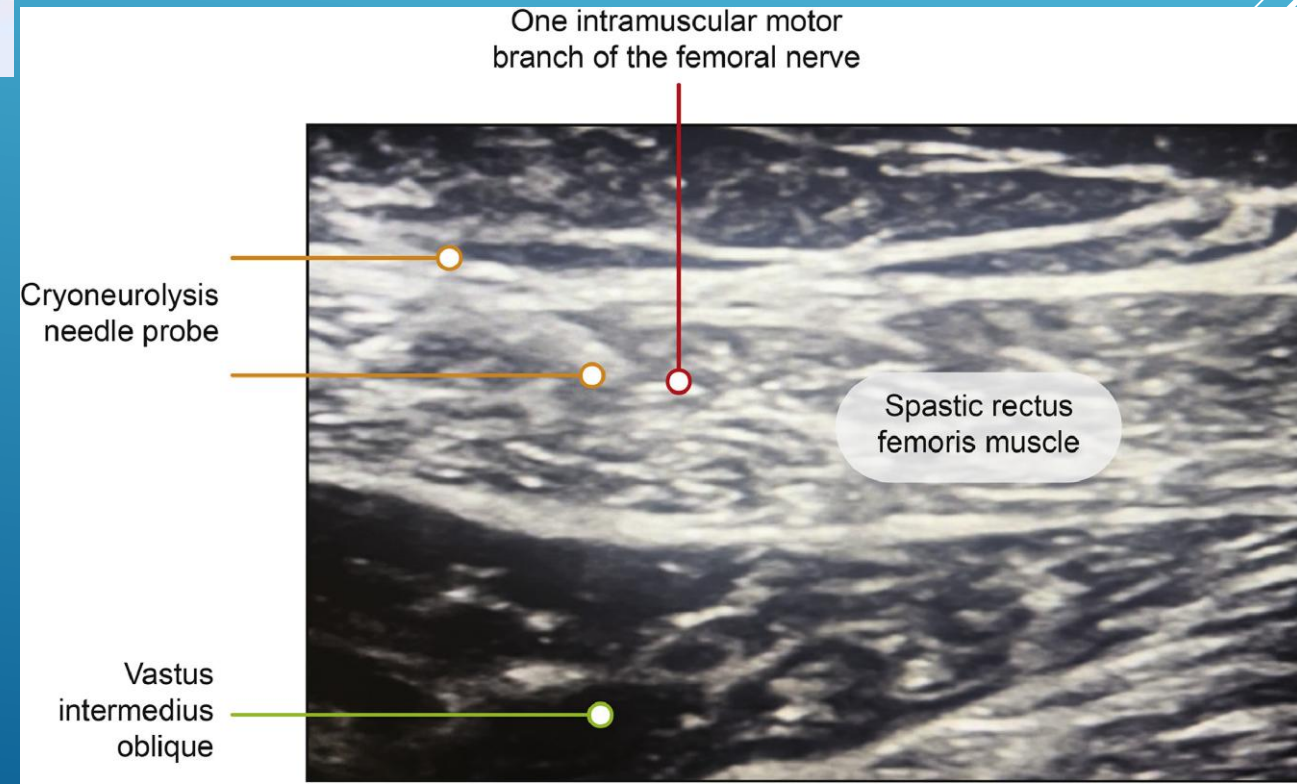

- ▶ Probe goes to neuromuscular junction
- ▶ Ultrasound guided

<https://www.archives-rct.org/article/S2590-1095%2825%2900001-1/fulltext>

[https://www.researchgate.net/figure/A-modern-cryoneurolysis-probe-cannula-produces-extremely-cold-temperatures-at-its-tip\\_fig1\\_320622193](https://www.researchgate.net/figure/A-modern-cryoneurolysis-probe-cannula-produces-extremely-cold-temperatures-at-its-tip_fig1_320622193)

# CRYONEUROLYSIS

# WHAT THE STUDIES HAVE SHOWN

- ▶ Looking at cryoneurolysis for refractory or plateaued upper limb spasticity
- ▶ Hashemi et al (Paul Winston's group) trialed cryoneurolysis in 59 adults with UE spasticity
  - ▶ Significant change baseline maximal PROM, AROM, MAS shoulder flexion, abduction, elbow extension
  - ▶ MAS improvement wrist extension, MAS and max PROM external rotation shoulder
  - ▶ Improved pain, satisfaction, upper limb disability

# CRYONEUROLYSIS PARTING THOUGHTS

- ▶ Still very novel with studies being completed currently
  - ▶ Need highly trained individual to perform
  - ▶ Protocols and specific muscle to address need to be confirmed
  - ▶ But...promising start
- 

A black and white photograph of an abacus, a traditional calculating tool. The abacus is made of light-colored wood and has several rows of dark, spherical beads. A pencil is resting diagonally across the middle of the abacus. The background is dark and out of focus.

# CASE STUDY 1

## CASE 1

- ▶ 37 yo female s/p CA with ROSC after 40 minutes with cardiogenic shock. Subsequent anoxic BI
  - ▶ Spastic quadriparesis with equinovarieties deformities bilateral legs
    - ▶ Also elements of rigidity
  - ▶ Cortical blindness
  - ▶ Severe anxiety with behavioral impairments
- ▶ Referred after rehab and home with 24/7 assist

## CASE 1

- ▶ Painful spasms with anxiety with any movement
- ▶ Could initiate movement R shoulder, hip and knee but limited
- ▶ Communication intact, cognition appropriate but somewhat sedated. Very, very, very, VERY anxious
- ▶ High dose baclofen, tizanidine, Sinemet, gabapentin, propranolol, Depakote, Seroquel, trazodone
- ▶ Failed cryoneurolysis for legs, has WC and some night splints for arms she doesn't tolerate
- ▶ ...so now what...???

# CASE 1

- ▶ A lot of medication weans/adjustments
- ▶ Dynamic splinting and stretching (sorta...) once pain & anxiety better controlled
- ▶ Botox for UE
- ▶ Referral to multispecialty clinic with evaluation for baclofen pump and surgical release for ankles
  
- ▶ Result: less pain, better sleep, less caregiver burden. Pending pump and surgical evaluations – other medical issues ongoing

QUESTIONS?

- ▶ Verduzco-Gutierrez M, Raghavan P, Pruenete J, Moon D, List C, Hornyak JE, Gul F, Deshpande S, Biffi S, Al Lawati Z, Alfaro, A. AAPM&R consensus guidance on spasticity assessment and management. *PM&R*. 2024; 16: 864-887.
