How to set up your graphic files:

Applications / File Types

Native application files we accept:

You may use any application to produce your files, but we will only accept the following native application files:

Illustrator (Vector Format)

Photoshop (Raster Format)

All other application files must be saved as one of the following file formats we accept. All fonts and externally referenced files must be included or embedded. Failure to do so will result in delay of your project.

We review all files prior to production and will contact you if there are problems.

File Formats we accept:

.eps
.tif
.jpeg
.psd
.ps
.pdf
.ai

Vector Format images can be designed at any size. If you are placing Raster Format (Bitmap) images into your vector designs they must be 300 dpi. Be sure to include the original placed image with the file upload or embed the images. All fonts must be converted to outline (paths) or the original fonts must be sent with your files.

Color Matching:

We match your intended colors as closely as possible. All of our equipment is color calibrated to exacting standards. If you desire us to match exact spot colors such as Pantone (PMS) we will require a hard copy proof strip (4"x24") approval signed by you. Additional charges apply. We currently charge \$15.00 per color strip plus shipping. Locals may view the proof at our location. We reserve the right to reject any project we feel will be too difficult for us to color match proofs.

We charge \$25 to mail hard copy proofs. This is usually an actual color print sample strip of the material used for your project.

Artwork Prep Guides

Our printing equipment is CMYK based. You should be working in CMYK mode or convert to CMYK mode to see a more accurate rendering of how your final printed product will appear. Many colors, especially spot colors, may look very different in CMYK mode than in RGB mode.

You can design most images at actual size using a minimum of 120 ppi. If your design has a lot of small text we recommend you set up your files in a vector application such as Illustrator and place all raster images into it. This will produce best results for clear sharp text. If the image is a photo only, you may be able to get by with 72 ppi at actual size.
