The procedure of removing water from and drying out the affected areas involves scientific methods and specialized equipment. It is critical to trust an experienced company so you can avoid costly repairs in the future.

The goal is to find the mold, give you a clear picture of the depth of the issue, and give you steps that will have to be taken to free your property of mold and health risks associated with mold.

We use "Green" cleaning agents that are non-toxic and EPA registered!

Tips to Prevent

- Perform regular maintenance check on your property, including replacing hoses on dishwasher, ice maker, and washer.
- Inspect caulking around windows and doors, replace as needed.
- Know where the main water shut off valve is located and check frequently to insure it is operational.
- Act quickly if a leak occurs; the longer you wait, the more likely mold will develop.
- Keep indoor humidity below 60% to prevent mold growth.
