Postmortem Incisions- Integrated Quick PYQ Snap

- I-Shaped Incision → Single midline cut from neck to pubis (Basic autopsy)
- Y-Shaped Incision → Most common; starts from both shoulders, meets at sternum, extends to pubis (Used in medicolegal cases)
- Modified Y-Shaped Incision → Extends behind ears (Better neck dissection in strangulation cases)
- U-Shaped Incision → Used for better neck examination (Hanging, strangulation)
- **Rokitansky Method** → In-situ dissection of organs (Without removing them together)
- **Virchow's Method** → Organ-by-organ removal (Common in routine autopsies)
- Letulle's Method → En bloc removal of all thoraco-abdominal organs
- Ghon's Method → Block removal (Thoracic, abdominal, and cervical organs in separate groups)

SURGERY

- Keloid scars show overgrowth beyond the wound margins, often recur after excision, and are more common in darker skin.
- Chromic catgut suture is an absorbable suture made from purified collagen treated with chromium salts to reduce tissue reaction and prolong absorption time.
- Intercostal drain (ICD) placement in tension pneumothorax is in the 5th intercostal space, anterior to the midaxillary line.
- Blast injury affects air-containing organs like lungs, intestines, and ears, with pulmonary barotrauma being the most lethal.
- Revised Trauma Score (RTS) components include Glasgow Coma Scale (GCS), systolic blood pressure, and respiratory rate.
- Extra-mucosal suture technique is commonly used in intestinal anastomosis to avoid mucosal inversion and maintain luminal patency.
- Compartment syndrome fasciotomy should be performed when compartment pressure exceeds 30 mmHg to prevent ischemic damage.
- Deaver retractor is used in abdominal surgeries, while Langenbeck retractor is used in soft tissue retraction.
- Best graft for femoropopliteal bypass is an autologous reversed great saphenous vein graft due to superior long-term patency.
- Glasgow Coma Scale (GCS) score of 3 indicates deep coma or death, while a score of 15 is normal.
- Modified Shock Index (MSI) is heart rate divided by mean arterial pressure, with values >1.3 indicating significant hypoperfusion.
- Peau d'orange in breast cancer is due to dermal lymphatic invasion causing skin edema and dimpling.
- Tamoxifen is used in ER/PR-positive breast cancer, while trastuzumab is used for HER2-positive cases.
