This table shows the relative performance information on each bull. They are in order by age, with the oldest first and the youngest last. A 3 month spread. All the weights are unadjusted actual weights on the dates above each column. The performance measures in red highlight the best performers in each category. These bulls were fed a corn ration limited to 2% of their body weight for 106 days prior to ultrasounding. They were never fat, but the ribeye area and intramuscular fat (IMF) measures indicate which bull's steaks would be the biggest and the juiciest.

The Wean WDA (Weight per Day of Age) ratio column shows which bulls grew the fastest while they were nursing. It is a measure of relative maternal power.

The Grass Gain column shows how many pounds they gained in the 87 days between weaning and starting to eat corn.

Scrotal circumference is shown (in centimeters) because university studies have shown a correlation between scrotal circumference and his daughters' fertility rates.
