

CONTINUITY AND DIFFERENTIABILITY (XII, R. S. AGGARWAL)

EXERCISE 9A (Pg.No.: 345)

1. Show that $f(x) = x^2$ is continuous at $x = 2$.

Sol. $f(x) = x^2$

Left hand limit at $x = 2$,

$$= \lim_{x \rightarrow 2^-} f(x) = \lim_{h \rightarrow 0^+} f(2-h) = \lim_{h \rightarrow 0^+} (2-h)^2 = \lim_{h \rightarrow 0^+} h^2 - 4h + 4 = (0)^2 - 4(0) + 4 = 4$$

Right hand limit at $x = 2$,

$$= \lim_{x \rightarrow 2^+} f(x) = \lim_{h \rightarrow 0^+} f(2+h) = \lim_{h \rightarrow 0^+} (2+h)^2 = \lim_{h \rightarrow 0^+} (4 + h^2 + 4h) = (4 + (0)^2 + 4(0)) = 4$$

Value of function at $x = 2$, $f(2) = (2)^2 = 4$

Since $\lim_{x \rightarrow 2^-} f(x) = \lim_{x \rightarrow 2^+} f(x) = f(2) = 4$. Hence, $f(x)$ is continuous at $x = 2$.

2. Show that $f(x) = (x^2 + 3x + 4)$ is continuous at $x = 1$.

Sol. $f(x) = (x^2 + 3x + 4)$

Left hand limit at $x = 1$,

$$\begin{aligned} &= \lim_{x \rightarrow 1^-} f(x) = \lim_{h \rightarrow 0^+} f(1-h) = \lim_{h \rightarrow 0^+} \{(1-h)^2 + 3(1-h) + 4\} = \lim_{h \rightarrow 0^+} (1+h^2 - 2h + 3 - 3h + 4) \\ &= \lim_{h \rightarrow 0^+} (h^2 - 5h + 8) = (0)^2 - 5(0) + 8 = 8 \end{aligned}$$

Right hand limit at $x = 1$,

$$\begin{aligned} &= \lim_{x \rightarrow 1^+} f(x) = \lim_{h \rightarrow 0^+} f(1+h) = \lim_{h \rightarrow 0^+} \{(1+h)^2 + 3(1+h) + 4\} \\ &= \lim_{h \rightarrow 0^+} (1+h^2 + 2h + 3 + 3h + 4) = \lim_{h \rightarrow 0^+} (h^2 + 5h + 8) = (0)^2 + 5(0) + 8 = 8 \end{aligned}$$

Value of function at $x = 1$,

$$f(1) = \{1^2 + 3(1) + 4\} = (1+3+4) = 8$$

Since $\lim_{x \rightarrow 1^-} f(x) = \lim_{x \rightarrow 1^+} f(x) = f(1) = 8$, Hence, $f(x)$ is continuous at $x = 1$

Prove that :

3. $f(x) = \begin{cases} \frac{x^2 - x - 6}{x - 3}, & \text{when } x \neq 3 \\ 5, & \text{when } x = 3 \end{cases}$ is continuous at $x = 3$.

Sol. $f(x) = \begin{cases} \frac{x^2 - x - 6}{x - 3}, & \text{when } x \neq 3 \\ 5, & \text{when } x = 3 \end{cases}$

$$f(x) = \begin{cases} \frac{x(x-3)+2(x-3)}{(x-3)}, & \text{when } x \neq 3 \\ 5, & \text{when } x = 3 \end{cases} \Rightarrow f(x) = \begin{cases} \frac{(x-3)(x+2)}{(x-3)}, & \text{when } x \neq 3 \\ 5, & \text{when } x = 3 \end{cases}$$

$$f(x) = \begin{cases} (x+2), & \text{when } x \neq 3 \\ 5, & \text{when } x = 3 \end{cases}$$

<https://millionstar.godaddysites.com/>

Now, left hand limit at $x = 3$,

$$\lim_{x \rightarrow 3^-} f(x) = \lim_{h \rightarrow 0^+} (3-h+2) = \lim_{h \rightarrow 0^+} (3-h+2) = \lim_{h \rightarrow 0^+} (5-h) = (5-0) = 5$$

And, Right hand limit at $x = 3$,

$$\lim_{x \rightarrow 3^+} f(x) = \lim_{h \rightarrow 0^+} f(3+h) = \lim_{h \rightarrow 0^+} \{(3+h)+2\} = \lim_{h \rightarrow 0^+} (3+h+2) = \lim_{h \rightarrow 0^+} (5+h) = (5+0) = 5$$

Value of function at $x = 3$,

$$f(x) = 5 \Rightarrow f(3) = 5$$

Since $\lim_{x \rightarrow 3^-} f(x) = \lim_{x \rightarrow 3^+} f(x) = f(3) = 5$. Hence, $f(x)$ is continuous at $x = 3$.

4. $f(x) = \begin{cases} \frac{x^2 - 25}{(x-5)}, & \text{when } x \neq 5 \\ 10, & \text{when } x = 5 \end{cases}$, is continuous at $x = 5$.

Sol. $f(x) = \begin{cases} \frac{(x)^2 - (5)^2}{(x-5)}, & \text{when } x \neq 5 \\ 10, & \text{when } x = 5 \end{cases} \Rightarrow f(x) = \begin{cases} \frac{(x-5)(x+5)}{(x-5)}, & \text{when } x \neq 5 \\ 10, & \text{when } x = 5 \end{cases}$

$$f(x) = \begin{cases} (x+5), & \text{when } x \neq 5 \\ 10, & \text{when } x = 5 \end{cases}$$

Now, left hand limit at $x = 5$,

$$\lim_{x \rightarrow 5^-} f(x) = \lim_{h \rightarrow 0^+} f(5-h) = \lim_{h \rightarrow 0^+} (5-h+5) = \lim_{h \rightarrow 0^+} (10-h) = (10-0) = 10.$$

And, Right hand limit at $x = 5$,

$$\lim_{x \rightarrow 5^+} f(x) = \lim_{h \rightarrow 0^+} f(5+h) = \lim_{h \rightarrow 0^+} (5+h+5) = \lim_{h \rightarrow 0^+} (10+h) = (10+0) = 10$$

Value of function at $x = 5$, $f(x) = 10 \Rightarrow f(5) = 10$

$$\lim_{x \rightarrow 5^-} f(x) = \lim_{x \rightarrow 5^+} f(x) = f(5) = 10. \text{ Hence, } f(x) \text{ is continuous at } x = 5.$$

5. $f(x) = \begin{cases} \frac{\sin 3x}{x}, & \text{when } x \neq 0 \\ 1, & \text{when } x = 0 \end{cases}$, is discontinuous at $x = 0$.

Sol. $f(x) = \begin{cases} \frac{\sin 3x}{x}, & \text{when } x \neq 0 \\ 1, & \text{when } x = 0 \end{cases}$

Left hand limit at $x = 0$,

$$\lim_{x \rightarrow 0^-} f(x) = \lim_{h \rightarrow 0^+} f(0-h) = \lim_{h \rightarrow 0^+} f(-h) = \lim_{h \rightarrow 0^+} \frac{\sin 3(-h)}{-h} = \lim_{h \rightarrow 0^+} \frac{\sin 3h}{h} = \lim_{h \rightarrow 0^+} \frac{\sin 3h}{3h} \cdot 3 = 3$$

And, Right hand limit at $x = 0$,

$$\lim_{x \rightarrow 0^+} f(x) = \lim_{h \rightarrow 0^+} f(0+h) = \lim_{h \rightarrow 0^+} f(h) = \lim_{h \rightarrow 0^+} \frac{\sin 3h}{h} = \lim_{h \rightarrow 0^+} \frac{\sin 3h}{3h} \cdot 3 = 3$$

Value of function at $x = 0$, $f(x) = 1 \Rightarrow f(0) = 1$

Since, $\lim_{x \rightarrow 0^-} f(x) = \lim_{x \rightarrow 0^+} f(x) \neq f(0)$. Hence, $f(x)$ is discontinuous at $x = 0$.

$$f(x) = \begin{cases} \frac{1-\cos x}{x^2}, & \text{when } x \neq 0 \\ 1, & \text{when } x = 0 \end{cases}, \quad \text{is discontinuous at } x = 0.$$

$$\text{Sol. } f(x) = \begin{cases} \frac{1-\cos x}{x^2}, & \text{when } x \neq 0 \\ 1, & \text{when } x = 0 \end{cases}$$

Left hand limit at $x = 0$,

$$\begin{aligned} \lim_{x \rightarrow 0^-} f(x) &= \lim_{h \rightarrow 0^+} f(0-h) = \lim_{h \rightarrow 0^+} f(-h) = \lim_{h \rightarrow 0^+} \frac{1-\cos(-h)}{(-h)^2} \\ &= \lim_{h \rightarrow 0^+} \frac{1-\cos h}{h^2} = \lim_{h \rightarrow 0^+} \frac{2\sin^2 h/2}{h^2} = \lim_{h \rightarrow 0^+} \frac{2 \cdot \sin h/2 \cdot \sin h/2}{h^2} \\ &= \lim_{h \rightarrow 0^+} 2 \frac{(\sin h/2)}{h/2} \times \frac{(\sin h/2)}{h/2} \times \frac{1}{4} = \frac{1}{2} \end{aligned}$$

And, Right hand limit at $x = 0$,

$$\begin{aligned} \lim_{h \rightarrow 0^+} f(x) &= \lim_{h \rightarrow 0^+} f(0+h) = \lim_{h \rightarrow 0^+} \frac{1-\cos h}{h^2} = \lim_{h \rightarrow 0^+} \frac{2\sin^2 h/2}{h^2} \\ &= \lim_{h \rightarrow 0^+} 2 \frac{(\sin h/2)}{h/2} \times \frac{(\sin h/2)}{h/2} \times \frac{1}{4} = \frac{1}{2} \end{aligned}$$

Value of function at $x = 0$, $f(x) = 1 \Rightarrow f(0) = 1$

Since, $\lim_{x \rightarrow 0^-} f(x) = \lim_{x \rightarrow 0^+} f(x) \neq f(0)$. Hence, $f(x)$ is discontinuous at $x = 0$

$$7. \quad f(x) = \begin{cases} 2-x, & \text{when } x < 2 \\ 2+x, & \text{when } x \geq 2 \end{cases} \quad \text{is discontinuous at } x = 2.$$

$$\text{Sol. } f(x) = \begin{cases} 2-x, & \text{when } x < 2 \\ 2+x, & \text{when } x \geq 2 \end{cases}$$

Left hand limit at $x = 2$,

$$\lim_{x \rightarrow 2^-} f(x) = \lim_{h \rightarrow 0^+} f(2-h) = \lim_{h \rightarrow 0^+} \{2 - (2-h)\} = \lim_{h \rightarrow 0^+} (2-2+h) = \lim_{h \rightarrow 0^+} h = 0$$

And, Right hand limit at $x = 2$,

$$\lim_{x \rightarrow 2^+} f(x) = \lim_{h \rightarrow 0^+} f(2+h) = \lim_{h \rightarrow 0^+} (2+2+h) = \lim_{h \rightarrow 0^+} (4+h) = (4+0) = 4$$

Value of function at $x = 2$, $f(x) = 2+x \Rightarrow f(2) = 2+2 \Rightarrow f(2) = 4$

Since, $\lim_{x \rightarrow 2^-} f(x) \neq \lim_{x \rightarrow 2^+} f(x) = f(2)$. Hence, $f(x)$ is discontinuous at $x = 2$.

$$8. \quad f(x) = \begin{cases} 3-x, & \text{when } x \leq 0 \\ x^2, & \text{when } x > 0 \end{cases} \quad \text{is discontinuous at } x = 0?$$

$$\text{Sol. } f(x) = \begin{cases} 3-x, & \text{when } x \leq 0 \\ x^2, & \text{when } x > 0 \end{cases}$$

Left hand limit at $x = 0$,

$$\lim_{x \rightarrow 0^-} f(x) = \lim_{h \rightarrow 0^+} f(0-h) = \lim_{h \rightarrow 0^+} \{3 - (-h)\} = \lim_{h \rightarrow 0^+} (3+h) = (3+0) = 3$$

And, Right hand limit at $x = 0$,

$$\lim_{x \rightarrow 0^+} f(x) = \lim_{h \rightarrow 0^+} f(0+h) = \lim_{h \rightarrow 0^+} f(h) = \lim_{h \rightarrow 0^+} (h)^2 = \lim_{h \rightarrow 0^+} h^2 = 0$$

Value of function at $x = 0$ <https://millionstar.godaddysites.com/>

$$f(x) = 3 - x \Rightarrow f(0) = 3 - 0 = f(0) = 3$$

Since, $\lim_{x \rightarrow 0^-} f(x) \neq \lim_{x \rightarrow 0^+} f(x)$.

Hence, $f(x)$ is discontinuous at $x = 0$.

9. $f(x) = \begin{cases} 5x - 4, & \text{when } 0 < x \leq 1 \\ 4x^2 - 3x, & \text{when } 1 < x < 2 \end{cases}$ is continuous at $x = 1$

Sol. $f(x) = \begin{cases} 5x - 4, & \text{when } 0 < x \leq 1 \\ 4x^2 - 3x, & \text{when } 1 < x < 2 \end{cases}$

$$\begin{aligned} \text{Left hand limit at } x = 1, \lim_{x \rightarrow 1^-} f(x) &= \lim_{h \rightarrow 0^+} f(1-h) = \lim_{h \rightarrow 0^+} 5(1-h) - 4 \\ &= \lim_{h \rightarrow 0^+} 5 - 5h - 4 = \lim_{h \rightarrow 0^+} 1 - 5h = 1 - 5(0) = 1 \end{aligned}$$

$$\begin{aligned} \text{Right hand limit at } x = 1, \lim_{x \rightarrow 1^+} f(x) &= \lim_{h \rightarrow 0^+} f(1+h) = \lim_{h \rightarrow 0^+} 4(1+h)^2 - 3(1+h) \\ &= \lim_{h \rightarrow 0^+} 4(1+h^2 + 2h) - 3 - 3h = 4 - 3 = 1 \end{aligned}$$

Value of function at $x = 1$, $f(x) = 5x - 4 \Rightarrow f(1) = 5 - 4 = 1$

Since, $\lim_{x \rightarrow 1^-} f(x) = \lim_{x \rightarrow 1^+} f(x) = f(1) = 1$. Hence, $f(x)$ is continuous at $x = 1$.

10. $f(x) = \begin{cases} x - 1, & \text{when } 1 \leq x < 2 \\ 2x - 3, & \text{when } 2 \leq x \leq 3 \end{cases}$ is continuous at $x = 2$.

Sol. $f(x) = \begin{cases} x - 1, & \text{when } 1 \leq x < 2 \\ 2x - 3, & \text{when } 2 \leq x \leq 3 \end{cases}$

$$\text{Left hand limit at } x = 2, \lim_{x \rightarrow 2^-} f(x) = \lim_{h \rightarrow 0^+} f(2-h) = \lim_{h \rightarrow 0^+} (2-h) - 1 = \lim_{h \rightarrow 0^+} 2 - h - 1 = 1$$

$$\text{Right hand limit at } x = 2, \lim_{x \rightarrow 2^+} f(x) = \lim_{h \rightarrow 0^+} f(2+h) = \lim_{h \rightarrow 0^+} 2(2+h) - 3 = \lim_{h \rightarrow 0^+} 4 + 2h - 3 = 1$$

Value of function at $x = 2$, $f(x) = 2x - 3 \Rightarrow f(2) = 2(2) - 3 \Rightarrow f(2) = 4 - 3 \Rightarrow f(2) = 1$

Since, $\lim_{x \rightarrow 2^-} f(x) = \lim_{x \rightarrow 2^+} f(x) = f(2) = 1$. Hence, $f(x)$ is continuous at $x = 2$.

11. $f(x) = \begin{cases} \cos x, & \text{when } x \geq 0 \\ -\cos x, & \text{when } x < 0 \end{cases}$, is discontinuous at $x = 0$.

Sol. $f(x) = \begin{cases} \cos x, & \text{when } x \geq 0 \\ -\cos x, & \text{when } x < 0 \end{cases}$

Left hand limit at $x = 0$,

$$\lim_{x \rightarrow 0^-} f(x) = \lim_{h \rightarrow 0^+} f(0-h) = \lim_{h \rightarrow 0^+} f(-h) = -\lim_{h \rightarrow 0^+} \cos(-h) = -\lim_{h \rightarrow 0^+} \cos h = -1$$

$$\text{Right hand limit at } x = 0, \lim_{x \rightarrow 0^+} f(x) = \lim_{h \rightarrow 0^+} f(0+h) = \lim_{h \rightarrow 0^+} f(h) = \lim_{h \rightarrow 0^+} \cos h = 1$$

Value of function at $x = 0$, $f(x) = \cos x \Rightarrow f(0) = \cos 0 \Rightarrow f(0) = 1$

Since, $\lim_{x \rightarrow 0^-} f(x) \neq \lim_{x \rightarrow 0^+} f(x) = f(0)$. Hence, $f(x)$ is discontinuous at $x = 0$

12. $f(x) = \begin{cases} \frac{|x-a|}{x-a}, & \text{when } x \neq a \\ 1, & \text{when } x = a \end{cases}$, is discontinuous at $x = a$

**CONTINUITY AND DIFFERENTIABILITY (**<https://millionstar.godaddysites.com/>

$$13. f(x) = \begin{cases} \frac{|x-a|}{x-a}, & \text{when } x \neq a \\ 1, & \text{when } x = a \end{cases}$$

Left hand limit at $x = 0$,

$$\lim_{x \rightarrow a^-} f(x) = \lim_{h \rightarrow 0^+} f(a-h) = \lim_{h \rightarrow 0^+} \frac{|a-h-a|}{a-h-a} = \lim_{h \rightarrow 0^+} \frac{|-h|}{-h} = \lim_{h \rightarrow 0^+} \frac{h}{-h} = -1$$

$$\text{Right hand limit at } x = a, \lim_{x \rightarrow a^+} f(x) = \lim_{h \rightarrow 0^+} f(0+h) = \lim_{h \rightarrow 0^+} \frac{|a+h-a|}{a+h-a} = \lim_{h \rightarrow 0^+} \frac{h}{h} = 1$$

Value of function at $x = a$, $f(x) = 1 \Rightarrow f(a) = 1$ Since, $\lim_{x \rightarrow a^-} f(x) \neq \lim_{x \rightarrow a^+} f(x) = f(a)$. Hence, $f(x)$ is discontinuous at $x = a$.

$$13. f(x) = \begin{cases} \frac{1}{2}(x - |x|), & \text{when } x \neq 0 \\ 2, & \text{when } x = 0 \end{cases}$$

$$\text{Sol. } f(x) = \begin{cases} \frac{1}{2}(x - |x|), & \text{when } x \neq 0 \\ 2, & \text{when } x = 0 \end{cases}$$

$$\text{Left hand limit at } x = 0, \lim_{x \rightarrow 0^-} f(x) = \lim_{h \rightarrow 0^+} f(0-h) = \lim_{h \rightarrow 0^+} (-h) = \lim_{h \rightarrow 0^+} \frac{1}{2}(-h - |-h|)$$

$$= \lim_{h \rightarrow 0^+} \frac{1}{2}(-h - h) = \lim_{h \rightarrow 0^+} \frac{1}{2} \times (-2h) = \lim_{h \rightarrow 0^+} (-h) = -\lim_{h \rightarrow 0^+} h = 0$$

$$\text{Right hand limit at } x = 0, \lim_{x \rightarrow 0^+} f(x) = \lim_{h \rightarrow 0^+} f(0+h) = \lim_{h \rightarrow 0^+} \frac{1}{2}(h - |h|) = \lim_{h \rightarrow 0^+} \frac{1}{2} \times 0 = 0$$

Value of function at $x = 0$, $f(x) = 2 \Rightarrow f(0) = 2$ Since, $\lim_{x \rightarrow 0^-} f(x) = \lim_{x \rightarrow 0^+} f(x) \neq f(0)$. Hence, $f(x)$ is discontinuous at $x = 0$.

$$14. f(x) = \begin{cases} \sin \frac{1}{x}, & \text{when } x \neq 0 \\ 0, & \text{when } x = 0 \end{cases}$$

$$\text{Sol. Left hand limit at } x = 0, \lim_{x \rightarrow 0^-} f(x) = \lim_{h \rightarrow 0} f(0-h) = \lim_{h \rightarrow 0^+} f(-h) = \lim_{h \rightarrow 0^+} \sin \left(\frac{1}{-h} \right) = -\infty$$

$$\text{Right hand limit at } x = 0, \lim_{x \rightarrow 0^+} f(x) = \lim_{h \rightarrow 0} f(0+h) = \lim_{h \rightarrow 0^+} f(h) = \lim_{h \rightarrow 0^+} \sin \left(\frac{1}{h} \right) = \infty$$

Value of function at $x = 0$, $f(x) = 0 \Rightarrow f(0) = 0$ Since, $\lim_{x \rightarrow 0^-} f(x) \neq \lim_{x \rightarrow 0^+} f(x) \neq f(0)$. Hence, $f(x)$ is discontinuous at $x = 0$.

$$15. f(x) = \begin{cases} 2x, & \text{when } x < 2 \\ 2, & \text{when } x = 2, \text{ is discontinuous at } x = 2 \\ x^2, & \text{when } x > 2 \end{cases}$$

$$\text{Sol. } f(x) = \begin{cases} 2x, & \text{when } x < 2 \\ 2, & \text{when } x = 2 \\ x^2, & \text{when } x > 2 \end{cases}$$

Left hand limit at $x = 2$, <https://millionstar.godaddysites.com/>

$$\lim_{x \rightarrow 2^-} f(x) = \lim_{h \rightarrow 0^+} f(2-h) = \lim_{h \rightarrow 0^+} 2(2-h) = \lim_{h \rightarrow 0^+} 4 - 2h = 4 - 2(0) = 4$$

Right hand limit at $x = 2$,

$$\lim_{x \rightarrow 2^+} f(x) = \lim_{h \rightarrow 0^+} f(2+h) = \lim_{h \rightarrow 0^+} (2+h)^2 = \lim_{h \rightarrow 0^+} 4 + h^2 + 4h = 4 + (0)^2 + 4(0) = 4$$

Value of function at $x = 2$, $f(x) = 2 \Rightarrow f(2) = 2$

Since, $\lim_{x \rightarrow 2^-} f(x) = \lim_{x \rightarrow 2^+} f(x) \neq f(2)$. Hence, $f(x)$ is discontinuous at $x = 2$.

16. $f(x) = \begin{cases} -x, & \text{when } x < 0 \\ 1, & \text{when } x = 0 \\ x, & \text{when } x > 0 \end{cases}$ is discontinuous at $x = 0$.

Sol. $f(x) = \begin{cases} -x, & \text{when } x < 0 \\ 1, & \text{when } x = 0 \\ x, & \text{when } x > 0 \end{cases}$

Left hand limit at $x = 0$, $\lim_{x \rightarrow 0^-} f(x) = \lim_{h \rightarrow 0^+} f(0-h) = \lim_{h \rightarrow 0^+} f(-h) = \lim_{h \rightarrow 0^+} -(-h) = \lim_{h \rightarrow 0^+} h = 0$

Right hand limit at $x = 0$, $\lim_{x \rightarrow 0^+} f(x) = \lim_{h \rightarrow 0^+} f(0+h) = \lim_{h \rightarrow 0^+} h = 0$

Value of function at $x = 0$, $f(x) = 1 \Rightarrow f(0) = 1$

Since, $\lim_{x \rightarrow 0^-} f(x) = \lim_{x \rightarrow 0^+} f(x) \neq f(0)$. Hence, $f(x)$ is discontinuous at $x = 0$

17. Find the value of k for which $f(x) = \begin{cases} \frac{\sin 2x}{5x}, & \text{when } x \neq 0 \\ k, & \text{when } x = 0 \end{cases}$, is continuous at $x = 0$.

Sol. $f(x) = \begin{cases} \frac{\sin 2x}{5x}, & \text{when } x \neq 0 \\ k, & \text{when } x = 0 \end{cases}$

Left hand limit at $x = 0$,

$$\lim_{x \rightarrow 0^-} f(x) = \lim_{h \rightarrow 0^+} f(0-h) = \lim_{h \rightarrow 0^+} f(-h) = \lim_{h \rightarrow 0^+} \frac{\sin 2(-h)}{5(-h)} = \lim_{h \rightarrow 0^+} \frac{-\sin 2h}{-5h} = \lim_{h \rightarrow 0^+} \frac{\sin 2h}{5h} = \frac{2}{5}$$

Value of function at $x = 0$, $f(x) = k \Rightarrow f(0) = k$

Since, $\lim_{x \rightarrow 0^-} f(x) = \lim_{x \rightarrow 0^+} f(x) = f(0) \Rightarrow \frac{2}{5} = k$. Hence, $k = \frac{2}{5}$

18. Find the value of λ for which $f(x) = \begin{cases} x+1, & \text{when } x \neq -1 \\ \lambda, & \text{when } x = -1 \end{cases}$, is continuous at $x = -1$.

Sol. $f(x) = \begin{cases} \frac{x^2 - 2x - 3}{x+1}, & \text{when } x \neq -1 \\ \lambda, & \text{when } x = -1 \end{cases}$

$$\Rightarrow f(x) = \begin{cases} \frac{x^2 - 3x + x - 3}{x+1}, & \text{when } x \neq -1 \\ \lambda, & \text{when } x = -1 \end{cases} \Rightarrow f(x) = \begin{cases} \frac{x(x-3) + 1(x-3)}{x+1}, & \text{when } x \neq -1 \\ \lambda, & \text{when } x = -1 \end{cases}$$

$$\Rightarrow f(x) = \begin{cases} \frac{(x-3)(x+1)}{x+1}, & \text{when } x \neq -1 \\ \lambda, & \text{when } x = -1 \end{cases} \quad \Rightarrow f(x) = \begin{cases} x-3, & \text{when } x \neq -1 \\ \lambda, & \text{when } x = -1 \end{cases}$$

Left hand limit at $x = -1$, $\lim_{x \rightarrow -1^-} f(x) = \lim_{h \rightarrow 0^+} f(-1-h) = \lim_{h \rightarrow 0^+} -1-h-3 = \lim_{h \rightarrow 0^+} -4-h = -4-0 = -4$

And value of function at $x = -1$, $f(x) = \lambda \Rightarrow f(-1) = \lambda$

Since, $\lim_{x \rightarrow -1^-} f(x) = \lim_{x \rightarrow -1^+} f(x) = f(-1) \Rightarrow -4 = \lambda$. Hence, $\lambda = -4$

19. For what value of k is the following function continuous at $x = 2$?

$$f(x) = \begin{cases} 2x+1, & x < 2 \\ k, & x = 2 \\ 3x-1, & x > 2 \end{cases}$$

$$\text{Sol. } f(x) = \begin{cases} 2x+1, & x < 2 \\ k, & x = 2 \\ 3x-1, & x > 2 \end{cases}$$

Left hand limit at $x = 2$,

$$\lim_{x \rightarrow 2^-} f(x) = \lim_{h \rightarrow 0^+} f(2-h) = \lim_{h \rightarrow 0^+} 2(2-h)+1 = \lim_{h \rightarrow 0^+} 4-2h+1 = \lim_{h \rightarrow 0^+} 5-2h = 5-2(0) = 5$$

Right hand limit at $x = 2$,

$$\lim_{x \rightarrow 2^+} f(x) = \lim_{h \rightarrow 0^+} f(2+h) = \lim_{h \rightarrow 0^+} 3(2+h)-1 = \lim_{h \rightarrow 0^+} 6+3h-1 = \lim_{h \rightarrow 0^+} 5+3h = 5+3(0) = 5$$

Value of function at $x = 2$, $f(x) = k = f(2) = k$

\therefore Left hand limit = right hand limit = value of function at $x = 2$

Hence, this function is continuous at $x = 2$. $\therefore k = 5$

20. For what value of k is the function $f(x) = \begin{cases} \frac{x^2-9}{x-3}, & \text{when } x \neq 3 \\ k, & \text{when } x = 3 \end{cases}$, is continuous at $x = 3$?

$$\text{Sol. } f(x) = \begin{cases} \frac{x^2-9}{x-3}, & \text{when } x \neq 3 \\ k, & \text{when } x = 3 \end{cases} \quad \Rightarrow f(x) = \begin{cases} \frac{(x-3)(x+3)}{x-3}, & \text{when } x \neq 3 \\ k, & \text{when } x = 3 \end{cases}$$

$$\Rightarrow f(x) = \begin{cases} (x+3), & \text{when } x \neq 3 \\ k, & \text{when } x = 3 \end{cases} \quad \Rightarrow f(x) = \begin{cases} x+3, & \text{when } x \neq 3 \\ k, & \text{when } x = 3 \end{cases}$$

Left hand limit at $x = 3$, $\lim_{x \rightarrow 3^-} f(x) = \lim_{h \rightarrow 0^+} f(3-h) = \lim_{h \rightarrow 0^+} (3-h)+3 = \lim_{h \rightarrow 0^+} 6-h = 6-0 = 6$

Value of function at $x = 3$, $f(x) = k$, $f(3) = k$

Since, $\lim_{x \rightarrow 3^-} f(x) = \lim_{x \rightarrow 3^+} f(x) = f(3) \Rightarrow 6 = k$. Hence, $k = 6$

21. Find the value of k for which the function $f(x) = \begin{cases} \frac{k \cos x}{\pi - 2x}, & \text{if } x \neq \frac{\pi}{2} \\ 3, & \text{if } x = \frac{\pi}{2} \end{cases}$ is continuous at $x = \pi/2$

Sol. $f(x) = \begin{cases} \frac{k \cos x}{\pi - 2x}, & \text{if } x \neq \frac{\pi}{2} \\ 3, & \text{if } x = \frac{\pi}{2} \end{cases}$

<https://millionstar.godaddysites.com/>

Since, $f(x)$ is continuous at $x = \pi/2$

Left hand limit at $x = \pi/2$,

$$\lim_{x \rightarrow \pi/2^-} f(x) = \lim_{h \rightarrow 0^+} f\left(\frac{\pi}{2} - h\right) = \lim_{h \rightarrow 0^+} \frac{k \cos(\pi/2 - h)}{\pi - 2(\pi/2 - h)} = \lim_{h \rightarrow 0^+} \frac{k \sin h}{2h} = \lim_{h \rightarrow 0^+} \frac{k}{2} \cdot \frac{\sin h}{h} = \frac{k}{2}$$

Right hand limit at $x = \pi/2$,

$$\text{Since, } \lim_{x \rightarrow \pi/2^+} f(x) = \lim_{h \rightarrow 0^+} f\left(\frac{\pi}{2} + h\right) = \lim_{h \rightarrow 0^+} \frac{k \cos(\pi/2 + h)}{\pi - 2(\pi/2 + h)} = \lim_{h \rightarrow 0^+} \frac{-k \sin h}{-2 \sin h} = \frac{k}{2}.$$

$$\text{So, } \frac{k}{2} = 3 \Rightarrow k = 6$$

22. Show that the function $f(x) = \begin{cases} x^2 \sin \frac{1}{x}, & \text{if } x \neq 0 \\ 0, & \text{if } x = 0 \end{cases}$, is continuous at $x = 0$

Sol. $f(x) = \begin{cases} x^2 \sin \frac{1}{x}, & \text{if } x \neq 0 \\ 0, & \text{if } x = 0 \end{cases}$

Left hand limit at $x = 0$,

$$\lim_{x \rightarrow 0^-} f(x) = \lim_{h \rightarrow 0^+} f(0 - h) = \lim_{h \rightarrow 0^+} f(-h) = \lim_{h \rightarrow 0^+} (-h)^2 \sin\left(\frac{1}{-h}\right) = \lim_{h \rightarrow 0^+} h^2 \sin\left(\frac{1}{h}\right) = 0$$

Right hand limit at $x = 0$,

$$\lim_{x \rightarrow 0^+} f(x) = \lim_{h \rightarrow 0^+} f(0 + h) = \lim_{h \rightarrow 0^+} f(h) = \lim_{h \rightarrow 0^+} h^2 \sin\left(\frac{1}{h}\right) = 0$$

Value of function at $x = 0 \Rightarrow f(x) = 0$

\therefore left hand limit = right hand limit = value of function = 0.

Hence this function is continuous at $x = 0$.

23. Show that : $f(x) = \begin{cases} x+1, & \text{if } x \geq 1 \\ x^2 + 1, & \text{if } x < 1 \end{cases}$ is continuous at $x = 1$

Sol. $f(x) = \begin{cases} x+1, & \text{if } x \geq 1 \\ x^2 + 1, & \text{if } x < 1 \end{cases}$

Left hand limit at $x = 1$,

$$\lim_{x \rightarrow 1^-} f(x) = \lim_{h \rightarrow 0^+} f(1 - h) = \lim_{h \rightarrow 0^+} (1 - h)^2 + 1 = \lim_{h \rightarrow 0^+} h^2 - 2h + 2 = (0)^2 - 2(0) + 2 = 2$$

Right hand limit at $x = 1$,

$$\lim_{x \rightarrow 1^+} f(x) = \lim_{h \rightarrow 0^+} f(1 + h) = \lim_{h \rightarrow 0^+} 1 + h + 1 = \lim_{h \rightarrow 0^+} 2 + h = 2 + 0 = 2$$

Value of function at $x = 1$, $f(x) = x + 1 = f(1) = 1 + 1 = f(1) = 2$

\therefore left hand limit = right hand limit = value of function = 2 at $x = 1$

Hence, this function is continuous at $x = 1$.

Show that : $f(x) = \begin{cases} x^3 - 3, & \text{if } x \leq 2 \\ x^2 + 1, & \text{if } x > 2 \end{cases}$, is continuous at $x = 2$.

$$\text{Sol. } f(x) = \begin{cases} x^3 - 3, & \text{if } x \leq 2 \\ x^2 + 1, & \text{if } x > 2 \end{cases}$$

Left hand limit at $x = 2$,

$$\lim_{x \rightarrow 2^-} f(x) = \lim_{h \rightarrow 0^+} f(2-h) = \lim_{h \rightarrow 0^+} (2-h)^3 - 3 = \lim_{x \rightarrow 2^+} 2^3 - h^3 - 3 \cdot 2 \cdot h(2-h) - 3 = 8 - 0 - 0 - 3 = 5$$

Right hand limit at $x = 2$,

$$\begin{aligned} \lim_{x \rightarrow 2^+} f(x) &= \lim_{h \rightarrow 0^+} f(2+h) = \lim_{h \rightarrow 0^+} (2+h)^2 + 1 \\ &= \lim_{h \rightarrow 0^+} 4 + h^2 + 4h + 1 = \lim_{h \rightarrow 0^+} h^2 + 4h + 5 = (0)^2 + 4(0) + 5 = 5 \end{aligned}$$

Value of function at $x = 2 \Rightarrow f(2) = (2)^3 - 3 \Rightarrow f(2) = 8 - 3 \Rightarrow f(2) = 5$

Since, left hand limit = right hand limit = value of function = 5 at $x = 2$.

Hence, this function is continuous at $x = 2$.

25. Find the values of a and b such that the following function is continuous

$$f(x) = \begin{cases} 5, & \text{when } x \leq 2 \\ ax + b, & \text{when } 2 < x < 10 \\ 21, & \text{when } x \geq 10 \end{cases}$$

Sol. We note that domain of $f = R$.

As the given function is continuous, it is continuous for all $x \in R$.

In particular, the function is continuous at $x = 2$ and at $x = 10$.

Continuity at $x = 2$: Here, $f(2) = 5$; $\lim_{x \rightarrow 2^-} f(x) = \lim_{x \rightarrow 2^-} 5 = 5$ and $\lim_{x \rightarrow 2^+} f(x) = \lim_{x \rightarrow 2^+} (ax + b) = 2a + b$

As the function f is continuous at $x = 2$,

$$\lim_{x \rightarrow 2^-} f(x) = \lim_{x \rightarrow 2^-} f(x) = f(2) \Rightarrow 5 = 2a + b = 5 \Rightarrow 2a + b = 5$$

Continuity at $x = 10$: Here, $f(10) = 21$;

$$\lim_{x \rightarrow 10^-} f(x) = \lim_{x \rightarrow 10^-} (ax + b) = 10a + b \text{ and } \lim_{x \rightarrow 10^+} f(x) = \lim_{x \rightarrow 10^+} 21 = 21$$

As the function f , is continuous at $x = 10$,

$$\lim_{x \rightarrow 10^-} f(x) = \lim_{x \rightarrow 10^+} f(x) = f(10) \Rightarrow 10a + b = 21 = 21 \Rightarrow 10a + b = 21$$

Solving (i) and (ii) simultaneously, we get $a = 2, b = 1$.

Hence, the given function f is continuous if $a = 2$ and $b = 1$.

26. Find the value of a for which the function f , defined as

$$f(x) = \begin{cases} a \sin \frac{\pi}{2}(x+1), & x \leq 0 \\ \frac{\tan x - \sin x}{x^3}, & x > 0 \end{cases} \quad \text{is continuous at } x = 0$$

Sol. Here $f(0) = a \sin \frac{\pi}{2}(0+1) = a \sin \frac{\pi}{2} = a \times 1 = a = a \times 1 = a$

$$\begin{aligned} \text{and } Lt_{x \rightarrow 0^+} f(x) &= Lt_{x \rightarrow 0^+} \frac{\tan x - \sin x}{x^3} = Lt_{x \rightarrow 0^+} \frac{\frac{\sin x}{\cos x} - \sin x}{x^3} \\ &= Lt_{x \rightarrow 0^+} \frac{\sin x(1 - \cos x)}{x^3 \cos x} = Lt_{x \rightarrow 0^+} \frac{\sin x(1 - \cos x)}{x^3 \cos x} \times \frac{1 + \cos x}{1 + \cos x} \\ &= Lt_{x \rightarrow 0^+} \frac{\sin x \cdot \sin^2 x}{x^3 \cos x (1 + \cos x)} = \left(Lt_{x \rightarrow 0^+} \frac{\sin x}{x} \right)^3 \cdot Lt_{x \rightarrow 0^+} \frac{1}{\cos x (1 + \cos x)} = 1^3 \cdot \frac{1}{1(1+1)} = \frac{1}{2} \end{aligned}$$

For the function f to be continuous at $x = 0$, we must have $Lt_{x \rightarrow 0^-} f(x) = Lt_{x \rightarrow 0^+} f(x) = f(0)$

$$\Rightarrow a = \frac{1}{2} = a \Rightarrow a = \frac{1}{2}. \text{ Hence, } a = \frac{1}{2}.$$

27. Prove that the function f given by $f(x) = |x - 3|, x \in R$ is continuous but not differentiable at $x = 3$

Sol. $f(x) = \begin{cases} 5-x, & x \leq 5 \\ x-5, & x \geq 5 \end{cases}$. Hence we have, $f(5) = 5 - 5 = 0$

$$\text{Now, } \lim_{x \rightarrow 3^+} f(x) = \lim_{h \rightarrow 0^+} f(3+h) = \lim_{h \rightarrow 0^+} (3+h-5) = 0$$

$$\lim_{x \rightarrow 3^-} f(x) = \lim_{h \rightarrow 0^+} f(3-h) = \lim_{h \rightarrow 0^+} 3 - (3-h) = \lim_{h \rightarrow 0^+} h = 0$$

$\therefore \lim_{x \rightarrow 3^+} f(x) = \lim_{x \rightarrow 3^-} f(x) = f(3)$. Thus, f is continuous at $x = 3$.

$$\text{Also, } Rf'(3) = (\text{RHD at } x = 3) = \lim_{h \rightarrow 0^+} \frac{f(3+h) - f(3)}{h} = \lim_{h \rightarrow 0^+} \frac{3+h-3-0}{h} = \lim_{h \rightarrow 0^+} \frac{h}{h} = 1$$

$$Lf'(3) = (\text{LHD at } x = 3) = \lim_{h \rightarrow 0^+} \frac{f(3-h) - f(3)}{-h} = \lim_{h \rightarrow 0^+} \frac{3-(3-h)-0}{-h} = \lim_{h \rightarrow 0^+} \frac{h}{-h} = -1$$

$\therefore Rf'(3) \neq Lf'(3)$. Hence, f is not differentiable at $x = 3$.

EXERCISE 9B (Pg. No.: 358)

1. Show that the function $f(x) = \begin{cases} 7x+5, & \text{when } x \geq 0 \\ 5-3x, & \text{when } x < 0 \end{cases}$, is a continuous function.

Sol. Left hand limit at $x = 0$,

$$\lim_{x \rightarrow 0^-} f(x) = \lim_{h \rightarrow 0^+} f(0-h) = \lim_{h \rightarrow 0^+} 5 + 3h = 5 + 3 \cdot 0 = 5$$

Right hand limit at $x = 0$,

$$\lim_{x \rightarrow 0^+} f(x) = \lim_{h \rightarrow 0^+} f(0+h) = \lim_{h \rightarrow 0^+} 7h + 5 = 7 \times 0 + 5 = 5$$

Value of function at $x = 0$, $f(x) = 7x+5$, $f(0) = 7 \times 0 + 5 = 5$

$\Rightarrow \lim_{x \rightarrow 0^-} f(x) = \lim_{x \rightarrow 0^+} f(x) = f(0) = 5$. This function is continuous at $x = 0$.

2. Show that the function $f(x) = \begin{cases} \sin x, & \text{if } x < 0 \\ x, & \text{if } x \geq 0 \end{cases}$ is continuous.

Sol. Left hand limit at $x = 0$, $\lim_{x \rightarrow 0^-} f(x) = \lim_{h \rightarrow 0^+} f(-h) = \lim_{h \rightarrow 0^+} \sin(-h) = -\lim_{h \rightarrow 0^+} \sin h = 0$

Right hand limit at $x = 0$, $\lim_{x \rightarrow 0^+} f(x) = \lim_{h \rightarrow 0^+} f(0+h) = \lim_{h \rightarrow 0^+} h = 0$

Value of function at $x = 0$, $f(x) = x$, $f(0) = 0$

$\Rightarrow \lim_{x \rightarrow 0^-} f(x) = \lim_{x \rightarrow 0^+} f(x) = f(0) = 0$. This function is continuous at $x = 0$.

<https://millionstar.godaddysites.com/>

Show that the function $f(x) = \begin{cases} \frac{x}{x-1}, & \text{when } x \neq 1 \\ n, & \text{when } x = 1 \end{cases}$ is continuous.

Sol. Left hand limit at $x=1$, $\lim_{x \rightarrow 1^-} f(x) = \lim_{h \rightarrow 0^+} f(1-h) = \lim_{h \rightarrow 0^+} \frac{(1-h)^n - 1^n}{(1-h)-1} = n(1)^{n-1} = n$

Right hand limit at $x=1$, $\lim_{x \rightarrow 1^+} f(x) = \lim_{h \rightarrow 0^+} f(1+h) = \lim_{h \rightarrow 0^+} \frac{(1+h)^n - 1^n}{(1+h)-1} = n(1)^{n-1} = n$

Value of function at $x=1$, $f(x)=n$, $f(1)=n$

$\Rightarrow \lim_{x \rightarrow 1^-} f(x) = \lim_{x \rightarrow 1^+} f(x) = f(1) = n$. This function is continuous at $x=n$

4. Show that $\sec x$ is a continuous function.

Sol. Let $f(x) = \sec x$. Let $x=c$ be any real number.

$$\lim_{x \rightarrow c} f(x) = \lim_{h \rightarrow 0^+} f(c+h) = \lim_{h \rightarrow 0^+} \sec(c+h) = \sec(c)$$

$$\text{Also, } f(x) = \sec c \quad \therefore \lim_{x \rightarrow c} f(x) = f(c)$$

$\therefore f(x)$, i.e., $\sec x$ is continuous at $x=c$. But $x=c$ is any real number.

$\therefore \sec x$ is continuous.

5. Show that $\cos|x|$ is a continuous function.

Sol. Let $f(x) = |x|$ and $g(x) = \cos x$, then $(gof)(x) = g\{f(x)\} = g\{|x|\} = \cos|x|$

Now, f and g being continuous it follows that their composite (gof) is continuous.

Hence, $\cos|x|$ is continuous.

6. Show that the function $f(x) = \begin{cases} \frac{\sin x}{x}, & \text{when } x \neq 0 \\ 2, & \text{when } x = 0 \end{cases}$ is continuous at each point except 0.

Sol. Left hand limit at $x=0 \Rightarrow \lim_{x \rightarrow 0^-} f(x) = \lim_{h \rightarrow 0^+} f(-h) = \lim_{h \rightarrow 0^+} \frac{\sin(-h)}{(-h)} = 1$

Right hand limit at $x=0 = \lim_{x \rightarrow 0^+} f(x) = \lim_{h \rightarrow 0^+} f(h) = \lim_{h \rightarrow 0^+} \frac{\sin h}{h} = 1$

Value of function at $x=0$, $f(x)=2$, $f(0)=2$

$\therefore \lim_{x \rightarrow 0^-} f(x) = \lim_{x \rightarrow 0^+} f(x) \neq f(0)$

7. Discuss the continuity of $f(x) = [x]$.

Sol. Let the integral value of $x=n$, $n \in I$

Let $f(x) = [x]$, is continuous at $x=n$, $n \in I$

At $x=n$, $f(x) = [n] = n$

LHL : $\lim_{x \rightarrow n^-} f(x) = \lim_{h \rightarrow 0^+} f(n-h) = \lim_{h \rightarrow 0^+} [n-h] = n-1$

RHL : $\lim_{x \rightarrow n^+} f(x) = \lim_{h \rightarrow 0^+} f(n+h) = \lim_{h \rightarrow 0^+} [n+h] = n$

So, LHL \neq RHL. Hence, $f(x)$ is discontinuous at $x=n$, $n \in I$.

<https://millionstar.godaddysites.com/>

Show that $f(x) = \begin{cases} (2x-1), & \text{if } x < 2 \\ \frac{3x}{2}, & \text{if } x \geq 2 \end{cases}$ is continuous.

Sol. Left hand limit at $x=2$, $\lim_{x \rightarrow 2^-} f(x) = \lim_{h \rightarrow 0^+} f(2-h) = \lim_{h \rightarrow 0^+} 2(2-h)-1$
 $= \lim_{h \rightarrow 0^+} 4-2h-1 = \lim_{h \rightarrow 0^+} 3-2h = 3-2 \times 0 = 3$

Right hand limit at $x=2$, $\lim_{x \rightarrow 2^+} f(x) = \lim_{h \rightarrow 0^+} f(2+h) = \lim_{h \rightarrow 0^+} 3 \frac{(2+h)}{2} = \frac{3(2+0)}{2} = \frac{6}{2} = 3$

Value of function at $x=2$, $f(x) = \frac{3x}{2}$, $f(2) = \frac{3 \cdot 2}{2} = 3$

$\therefore \lim_{x \rightarrow 2^-} f(x) = \lim_{x \rightarrow 2^+} f(x) = f(2) = 3$. This function is continuous at $x=2$

9. Show that $f(x) = \begin{cases} x, & \text{if } x \neq 0 \\ 1, & \text{if } x = 0 \end{cases}$ is continuous at each point except 0.

Sol. Left hand limit at $x=0$, $\lim_{x \rightarrow 0^-} f(x) = \lim_{x \rightarrow 0^+} f(x) = \lim_{h \rightarrow 0^+} (-h) = 0$

Right hand limit at $x=0$, $\lim_{x \rightarrow 0^+} f(x) = \lim_{h \rightarrow 0^+} f(h) = \lim_{h \rightarrow 0^+} h = 0$

Value of function at $x=0$, $f(x) = 1$, $f(0) = 1$

$\lim_{x \rightarrow 0^-} f(x) = \lim_{x \rightarrow 0^+} f(x) \neq f(0)$

This function is discontinuous at $x=0$. Again $f(x) = \begin{cases} x, & \text{if } x \neq 1 \\ 1, & \text{if } x = 1 \end{cases}$

Left hand limit at $x=1$, $\lim_{x \rightarrow 1^-} f(x) = \lim_{h \rightarrow 0^+} (1-h) = \lim_{h \rightarrow 0^+} (1-h) = 1-0 = 1$

Right hand limit at $x=1$, $\lim_{x \rightarrow 1^+} f(x) = \lim_{h \rightarrow 0^+} f(1+h) = \lim_{h \rightarrow 0^+} (1+0) = 1$

Value of function at $x=1$, $f(x) = x$, $f(1) = 1$

$\lim_{x \rightarrow 1^-} f(x) = \lim_{x \rightarrow 1^+} f(x) = f(1) = 1$

\therefore This function is continuous at $x=1$.

10. Locate the point of discontinuity of the function $f(x) = \begin{cases} (x^3 - x^2 + 2x - 2), & \text{if } x \neq 1 \\ 4, & \text{if } x = 1 \end{cases}$

Sol. The only doubtful point is $x=1$. Hence, we check the continuity at $x=1$

Left hand limit at $x=1$,

$$\begin{aligned} \lim_{x \rightarrow 1^-} f(x) &= \lim_{h \rightarrow 0^+} f(1-h) = \lim_{h \rightarrow 0^+} (1-h)^3 - (1-h)^2 + 2(1-h) - 2 \\ &= \lim_{h \rightarrow 0^+} (1-h)^3 - (1-h)^2 + 2(1-h) - 2 = (1-0)^3 - (1-0)^2 + 2(1-0) - 2 = 0 \end{aligned}$$

$$\begin{aligned} \text{Right hand limit at } x=1, \quad \lim_{x \rightarrow 1^+} f(x) &= \lim_{h \rightarrow 0^+} f(1+h) = \lim_{h \rightarrow 0^+} (1+h)^3 - (1+h)^2 + 2(1+h) - 2 \\ &= (1+0)^3 - (1+0)^2 + 2(1+0) - 2 = 0 \end{aligned}$$

Value of function at $x=1$, $f(x) = 4$, $f(1) = 4$

$\Rightarrow \lim_{x \rightarrow 1^-} f(x) = \lim_{x \rightarrow 1^+} f(x) \neq f(1)$. This function is discontinuous at $x=1$.

Discuss the continuity of the function $y(x) = |x| + |x - 1|$ in the interval $[-1, 2]$.

Sol. Given $\Rightarrow f(x) = \begin{cases} -x - x - 1 & \text{if } x \leq 0 \\ x - x - 1 & \text{if } 0 \leq x \leq 1 \\ x + x - 1 & \text{if } x \geq 1 \end{cases}$. Hence, only doubtful point.

EXERCISE 9C (Pg.No.: 364)

1. Show that $f(x) = x^3$, is continuous as well as differentiable at $x = 3$.

Sol. Left hand limit at $x = 3$, $\lim_{x \rightarrow 3^-} f(x) = \lim_{h \rightarrow 0^+} f(3-h) = \lim_{h \rightarrow 0^+} (3-h)^3 = (3-0)^3 = 27$

Right hand limit at $x = 3$, $\lim_{x \rightarrow 3^+} f(x) = \lim_{h \rightarrow 0^+} f(3+h) = \lim_{h \rightarrow 0^+} (3+h)^3 = (3+0)^3 = 27$

Value of function at $x = 3$, $f(x) = x^3 = f(3) = (3)^3 = 27$

$$\lim_{x \rightarrow 3^-} f(x) = \lim_{x \rightarrow 3^+} f(x) = f(3) = 27$$

Left hand derivative at $x = 3$

$$\begin{aligned} Lf'(3) &= \lim_{x \rightarrow 3^-} \frac{f(x) - f(3)}{x - 3} = \lim_{h \rightarrow 0^+} \frac{f(3-h) - f(3)}{0 - h} = \lim_{h \rightarrow 0^+} \frac{(3-h)^3 - (3)^3}{-h} \\ &= \lim_{h \rightarrow 0^+} \frac{(3)^3 - (h)^3 - 3(3)^2 \cdot h + 3(h)^2 \cdot 3 - 27}{-h} = \lim_{h \rightarrow 0^+} \frac{-h^3 - 27h + 9h^2}{-h} \\ &= \lim_{h \rightarrow 0^+} \frac{-h(h^2 + 27 - 9h)}{-h} = (0)^2 + 27 - 9 \times 0 = 27 \end{aligned}$$

Right hand derivative at $x = 3$

$$\begin{aligned} Rf'(3) &= \lim_{x \rightarrow 3^+} \frac{f(x) - f(3)}{x - 3} = \lim_{h \rightarrow 0^+} \frac{f(3+h) - f(3)}{h} = \lim_{h \rightarrow 0^+} \frac{(3+h)^3 - (3)^3}{h} \\ &= \lim_{h \rightarrow 0^+} \frac{(3)^3 + h^3 + 3(3)^2 h + 3(h)^2 \cdot 3 - 27}{h} \\ &= \lim_{h \rightarrow 0^+} \frac{h^3 + 27h + 9h^2}{h} = \lim_{h \rightarrow 0^+} \frac{h(h^2 + 27 + 9h)}{h} = 0 + 27 + 9 \times 0 = 27 \end{aligned}$$

$\Rightarrow Lf'(3) = Rf'(3)$. Hence, the function is continuous as well as differentiable at $x = 3$.

2. Show that $f(x) = (x-1)^{1/3}$ is differentiable at $x = 1$.

Sol. Left hand derivative at $x = 1$

$$\begin{aligned} Lf'(1) &= \lim_{x \rightarrow 1^-} \frac{f(x) - f(1)}{x - 1} = \lim_{h \rightarrow 0^+} \frac{f(1-h) - f(1)}{(1-h-1)} = \lim_{h \rightarrow 0^+} \frac{(1-h-1)^{1/3} - (1-1)^{1/3}}{-h} \\ &= \lim_{h \rightarrow 0^+} \frac{(-h)^{1/3} - 0}{-h} = \lim_{h \rightarrow 0^+} \frac{h^{1/3}}{h} = \lim_{h \rightarrow 0^+} \frac{1}{h^{2/3}} = \infty \end{aligned}$$

Right hand derivative at $x = 1$

$$Rf'(1) = \lim_{x \rightarrow 1^+} \frac{f(x) - f(1)}{x - 1} = \lim_{h \rightarrow 0^+} \frac{f(1+h) - f(1)}{(1+h-1)} = \lim_{h \rightarrow 0^+} \frac{(1+h-1)^{1/3} - (1-1)^{1/3}}{h}$$

$$= \lim_{h \rightarrow 0^+} \frac{h^{1/3} - 0}{h} = \lim_{h \rightarrow 0^+} \frac{\frac{d}{dh}(h^{1/3})}{\frac{d}{dh}(h)} = \lim_{h \rightarrow 0^+} \frac{\frac{1}{3}h^{-2/3}}{1} = \infty$$

Hence $Lf'(1) \neq Rf'(1)$. This function is not differentiable at $x = 1$.

3. Show that a constant function is always differentiable.

Sol. Let the function $f(x) = \lambda$, where λ is constant

We will discuss differentiability at $x = a$.

$$\therefore f'(a^-) = \lim_{h \rightarrow 0^+} \frac{f(a-h) - f(a)}{-h} = \lim_{h \rightarrow 0^+} \frac{\lambda - \lambda}{-h} = 0$$

$$\text{and } f'(a^+) = \lim_{h \rightarrow 0^+} \frac{f(a+h) - f(a)}{h} = \lim_{h \rightarrow 0^+} \frac{\lambda - \lambda}{h} = 0$$

$\therefore LHD = RHD$. Hence, the function is always differentiable.

4. Show that $f(x) = |x - 5|$ is continuous but not differentiable at $x = 5$.

Sol. Left hand limit at $x = 5$, $\lim_{x \rightarrow 5^-} f(x) = \lim_{h \rightarrow 0^+} (5-h) = \lim_{h \rightarrow 0^+} |5-h-5| = \lim_{h \rightarrow 0^+} h = 0$

Right hand limit at $x = 5$, $\lim_{x \rightarrow 5^+} f(x) = \lim_{h \rightarrow 0^+} f(5+h) = \lim_{h \rightarrow 0^+} |5+h-5| = \lim_{h \rightarrow 0^+} |h| = 0$

Value of function at $x = 5$, $f(x) = |x - 5|$, $f(5) = |5-5| = 0$

$$\lim_{x \rightarrow 5^-} f(x) = \lim_{x \rightarrow 5^+} f(x) = f(5) = 0$$

Left hand derivative at $x = 5$

$$\begin{aligned} \text{As, } Lf'(5) &= \lim_{x \rightarrow 5^-} \frac{f(x) - f(5)}{x - 5} = \lim_{h \rightarrow 0^+} \frac{f(5-h) - f(5)}{-h} = \lim_{h \rightarrow 0^+} \frac{|5-h-5| - |5-5|}{-h} \\ &= \lim_{h \rightarrow 0^+} \frac{|-h|}{-h} = \lim_{h \rightarrow 0^+} \frac{h}{-h} = -1 \end{aligned}$$

Right hand derivative at $x = 5$

$$Rf'(5) = \lim_{x \rightarrow 5^+} \frac{f(x) - f(5)}{x - 5} = \lim_{h \rightarrow 0^+} \frac{f(5+h) - f(5)}{h} = \lim_{h \rightarrow 0^+} \frac{|5+h-5| - |5-5|}{h} = \lim_{h \rightarrow 0^+} \frac{|h|}{h} = \lim_{h \rightarrow 0^+} \frac{h}{h} = 1$$

$Lf'(5) \neq Rf'(5)$. Hence, the function is continuous but not differentiable at $x = 5$.

5. Let $f(x) = \begin{cases} (2-x), & \text{when } x \geq 1 \\ x, & \text{when } 0 \leq x < 1 \end{cases}$. Show that $f(x)$ is continuous but not differentiable at $x = 1$.

Sol. Left hand limit at $x = 1$, $\lim_{x \rightarrow 1^-} f(x) = \lim_{h \rightarrow 0^+} f(1-h) = \lim_{h \rightarrow 0^+} (1-h) = (1-0) = 1$

Right hand limit at $x = 1$, $\lim_{x \rightarrow 1^+} f(x) = \lim_{h \rightarrow 0^+} f(1+h) = \lim_{h \rightarrow 0^+} 2 - (1+h) = \lim_{h \rightarrow 0^+} 1-h = 1-0 = 1$

Value of function at $x = 1$, $f(x) = 2-x$ or x , $f(1) = 2-1$ or 1 , $f(1) = 1$

$$\lim_{x \rightarrow 1^-} f(x) = \lim_{x \rightarrow 1^+} f(x) = f(1) = 1$$

Left hand derivative at $x = 1$

$$Lf'(1) = \lim_{x \rightarrow 1^+} \frac{f(x) - f(1)}{x - 1} = \lim_{h \rightarrow 0^+} \frac{f(1-h) - f(1)}{-h} = \lim_{h \rightarrow 0^+} \frac{1-h-1}{-h} = \lim_{h \rightarrow 0^+} \frac{-h}{-h} = 1$$

Right hand derivative at $x = 1$

$$Rf'(1) = \lim_{x \rightarrow 1^+} \frac{f(x) - f(1)}{x - 1} = \lim_{h \rightarrow 0^+} \frac{f(1+h) - f(1)}{h} = \lim_{h \rightarrow 0^+} \frac{2 - (1+h) - (2-1)}{h} = \lim_{h \rightarrow 0^+} \frac{(-h)}{h} = -1$$

$Lf'(1) \neq Rf'(1)$. Hence, the $f(x)$ is continuous but not differentiable at $x=1$.

Show that $f(x) = [x]$ is neither continuous nor derivable at $x=2$.

Sol. L.H.L = $\lim_{x \rightarrow 2^-} f(x) = \lim_{x \rightarrow 2^-} [x] = \lim_{h \rightarrow 0^+} [2-h] = \lim_{h \rightarrow 0^+} (1) = 1$

R.H.L = $\lim_{x \rightarrow 2^+} f(x) = \lim_{x \rightarrow 2^+} [x] = \lim_{h \rightarrow 0^+} [2+h] = \lim_{h \rightarrow 0^+} (2) = 2$

Again left hand derivative at $x=2$. $\therefore \lim_{x \rightarrow 2^-} f(x) \neq \lim_{x \rightarrow 2^+} f(x)$

$$Lf'(2) = \lim_{x \rightarrow 2^-} \frac{f(x) - f(2)}{x - 2} = \lim_{x \rightarrow 2^-} \frac{[x] - [2]}{x - 2} = \lim_{h \rightarrow 0^+} \frac{[2-h] - 2}{2-h-2} = \lim_{h \rightarrow 0^+} \frac{1-2}{-h} = \lim_{h \rightarrow 0^+} \frac{1}{h} = \infty$$

$\therefore Lf'(2)$ does not exist.

Right hand derivative at $x=2$

$$Rf'(2) = \lim_{x \rightarrow 2^+} \frac{f(x) - f(2)}{x - 2} = \lim_{x \rightarrow 2^+} \frac{[x] - [2]}{x - 2} = \lim_{h \rightarrow 0^+} \frac{[2+h] - 2}{2+h-2} = \lim_{h \rightarrow 0^+} \frac{2-2}{h} = 0$$

$\therefore Lf'(2) \neq Rf'(2) \Rightarrow f$ is not derivable at $x=2$

Hence, the $f(x)$ is neither continuous nor derivable at $x=2$.

7. Show that the function $f(x) = \begin{cases} (1-x), & \text{when } x < 1 \\ (x^2 - 1), & \text{when } x \geq 1 \end{cases}$ is continuous but not differentiable at $x=1$.

Sol. Left hand limit at $x=1$, $\lim_{x \rightarrow 1^-} f(x) = \lim_{h \rightarrow 0^+} f(1-h) = \lim_{h \rightarrow 0^+} 1 - (1-h) = \lim_{h \rightarrow 0^+} h = 0$

Right hand limit at $x=1$, $\lim_{x \rightarrow 1^+} f(x) = \lim_{h \rightarrow 0^+} f(1+h) = \lim_{h \rightarrow 0^+} (1+h)^2 - 1 = 0$

Value of function at $x=1$, $f(x) = x^2 - 1$, $f(1) = (1)^2 - 1 = 0$

$$\lim_{x \rightarrow 1^-} f(x) = \lim_{x \rightarrow 1^+} f(x) = f(1) = 0$$

Again, left hand derivative at $x=1$

$$Lf'(1) = \lim_{x \rightarrow 1^-} \frac{f(x) - f(1)}{x - 1} = \lim_{h \rightarrow 0^+} \frac{f(1-h) - f(1)}{-h} = \lim_{h \rightarrow 0^+} \frac{\{1-(1-h)\} - \{1-1\}}{-h}$$

$$= \lim_{h \rightarrow 0^+} \frac{h-0}{-h} = \lim_{h \rightarrow 0^+} \frac{h}{-h} = -1$$

Right hand derivative at $x=1$

$$Rf'(1) = \lim_{x \rightarrow 1^+} \frac{f(x) - f(1)}{x - 1} = \lim_{h \rightarrow 0^+} \frac{f(1+h) - f(1)}{h} = \lim_{h \rightarrow 0^+} \frac{\{(1+h)^2 - 1\} - \{1-1\}}{h}$$

$$= \lim_{h \rightarrow 0^+} \frac{(1+2h+h^2-1)}{h} = \lim_{h \rightarrow 0^+} \frac{h(2+h)}{h} = \frac{0(2+0)}{0} = 0$$

$Lf'(1) \neq Rf'(1)$. Hence the $f(x)$ is continuous but not differentiable at $x=1$.

8. Let $f(x) = \begin{cases} (2+x), & \text{if } x \geq 0 \\ (2-x), & \text{if } x < 0 \end{cases}$. Show that $f(x)$ is not derivable at $x=0$.

Sol. Left hand derivative at $x=0$, $\lim_{x \rightarrow 0^-} \frac{f(x) - f(0)}{x - 0} = \lim_{h \rightarrow 0^+} \frac{f(-h) - f(0)}{-h}$

$$= \lim_{h \rightarrow 0^+} \frac{\{2-(-h)\} - \{2-0\}}{-h} = \lim_{h \rightarrow 0^+} \frac{2+h-2}{-h} = \lim_{h \rightarrow 0^+} \frac{h}{-h} = -1$$

Right hand derivative at $x=0$, $\lim_{x \rightarrow 0^+} \frac{f(x) - f(0)}{x - 0}$

$$= \lim_{h \rightarrow 0^+} \frac{f(h) - f(0)}{h} = \lim_{h \rightarrow 0^+} \frac{(2+h) - (2+0)}{h} = \lim_{h \rightarrow 0^+} \frac{2+h-2}{h} = \lim_{h \rightarrow 0^+} \frac{h}{h} = 1$$

$Lf'(0) \neq Rf'(0)$. Hence, the $f(x)$ is not derivable at $x=0$.

9. If $f(x) = |x|$, show that $f'(2) = 1$.

Sol. Left hand derivative at $x=2$

$$Lf'(2) = \lim_{h \rightarrow 0^+} \frac{f(2-h) - f(2)}{-h} = \lim_{h \rightarrow 0^+} \frac{|2-h| - |2|}{-h} = \lim_{h \rightarrow 0^+} \frac{2-h-2}{-h} = \lim_{h \rightarrow 0^+} \frac{-h}{-h} = 1$$

Right hand derivative at $x=2$

$$Rf'(2) = \lim_{h \rightarrow 0^+} \frac{f(2+h) - f(2)}{h} = \lim_{h \rightarrow 0^+} \frac{2+h-2}{h} = \lim_{h \rightarrow 0^+} \frac{h}{h} = 1$$

Hence, $Lf'(2) = Rf'(2) = 1$

10. Find the values of a and b so that the function $f(x) = \begin{cases} (x^2 + 3x + a), & \text{when } x \leq 1 \\ (bx + 2), & \text{when } x > 1 \end{cases}$ is differentiable at each $x \in R$.

Sol. Since $f(x)$ is derivable for every x :

$\therefore f(x)$ is derivative at $x=1 \Rightarrow f$ is continuous at $x=1$

$$\Rightarrow \lim_{x \rightarrow 1^-} f(x) = f(1) = \lim_{x \rightarrow 1^+} f(x) \Rightarrow \lim_{x \rightarrow 1^-} (x^2 + 3x + a) = 1 + 3 + a = \lim_{x \rightarrow 1^+} (bx + 2)$$

$$\Rightarrow 1 + 3 + a = 1 + 3 + a = b + 2 \Rightarrow 4 + a = 4 + a = b + 2$$

$$\Rightarrow 4 + a = b + 2 \Rightarrow b = a + 2 \quad \dots(1)$$

$$\text{Now, } Lf'(1) = \lim_{x \rightarrow 1^+} \frac{f(x) - f(1)}{x - 1} = \lim_{x \rightarrow 1^-} \frac{(x^2 + 3x + a) - (1 + 3 + a)}{x}$$

$$= \lim_{x \rightarrow 1^-} \frac{x^2 + 3x - 4}{x - 1} = \lim_{x \rightarrow 1^-} \frac{(x+4)(x-1)}{(x-1)} = \lim_{x \rightarrow 1^-} (x+4) = \lim_{h \rightarrow 0^+} (1-h+4) = 5$$

$$Rf'(1) = \lim_{x \rightarrow 1^+} \frac{f(x) - f(1)}{x - 1} = \lim_{x \rightarrow 1^+} \frac{bx + 2 - (1 + 3 + a)}{x - 1}$$

$$= \lim_{x \rightarrow 1^+} \frac{bx - a - 2}{x - 1} = \lim_{x \rightarrow 1^+} \frac{(a+2)x - a - 2}{(x-1)} \quad [\text{Using (1)}]$$

$$= \lim_{x \rightarrow 1^+} \frac{a(x-1) + 2(x-1)}{(x-1)} = \lim_{x \rightarrow 1^+} \frac{(a+2)(x-1)}{(x-1)} = \lim_{x \rightarrow 1^+} (a+2) = \lim_{h \rightarrow 0^+} (a+2) = (a+2)$$

Since $Lf'(1) = Rf'(1) \therefore 5 = a + 2$, here $b = a + 2 \therefore b = 3 + 2 = 5$ Hence, $a = 3, b = 5$
