DID YOU HAVE COMPLICATIONS DURING PREGNANCY?
❤️ You may be at a higher risk for heart disease over your lifetime

Which pregnancy complications can increase your risk for heart disease as you age?

**HIGH BLOOD PRESSURE**
- 5-10% of all pregnant women

**GESTATIONAL DIABETES**
- 7-14% of all pregnancies

**PRETERM BIRTH**
- 11.5% of babies were born preterm in 2012.

- Gestational hypertension
- Preeclampsia (once known as Pregnancy Induced Hypertension (PIH) and Toxemia)
- Eclampsia
- HELLP syndrome

If you had PREECLAMPSIA, you have 2x the risk of stroke, heart muscle damage, or blood clot and 4x the risk of developing high blood pressure for the rest of your life!

If you had GESTATIONAL DIABETES, you are 50% more likely to develop Type II diabetes within 5 years, putting you at higher risk for heart disease.

Women with PRETERM BIRTH AND PREECLAMPSIA have an 8-10x higher chance of death from heart disease.

If you had complications in pregnancy, you can lower your risk:

**New Mothers**

- See your health care provider 3-6 months after birth to check your overall physical health. Discuss your pregnancy and any complications you experienced.
- Get a copy of your pregnancy and post-delivery medical records to share with your providers for the rest of your life. Don't wait – records may be destroyed.
- Breastfeed as long as possible. Women whose total lifetime breastfeeding is 6-12 months were 10% less likely to develop heart disease (and it’s good for baby too).

If you had one of these complications, speak with your provider when planning your next pregnancy to optimize your health.

**Mothers With Kids Over One Year**

- Get annual checkups and be screened for heart disease. At this visit, your provider should check your overall physical condition.
- Ask your provider what your test results mean and how you can lower your heart disease risk.
- Try a mobile app to automatically retrieve and store your medical records, so you always have them handy.
- Eat healthy! A diet low in salt, fat, cholesterol and sugar can help you lower your risk for obesity, diabetes and heart disease.
- Maintain a healthy weight. Body Mass Index (BMI) is an estimate of body fat based on height and weight. Less than 25 is healthy.
- Get active for 30 minutes a day, or as recommended by your provider.
- If you smoke, make a plan to quit. Your provider may have resources to support you.
- Take medications as directed. Sometimes a healthy diet and exercise is not enough to lower your risk for heart disease, so your provider may prescribe medications to help.

If you had complications during pregnancy, get more information and stay heart healthy.
