Custom Trilocks from .7600" to 6.0100"

FOR LARGE DIMENSIONS

When you need to inspect large diameters, Trilock Plug Gages are your best solution. Much like Reversible Plug Gages, when one end wears out, simply turn the member around and continue gaging. This significantly increases the gaging life of your gage. Members are securely attached to your trilock handle with mounting bolts. Custom Plug Gage assemblies can be marked with your tool number. Go/NoGo assemblies include 1 line (up to 25 characters) of custom marking. These Trilock Plug Gages are available up to 6" in all class tolerances to meet your unique requirements.

Custom Progressive Gages from .1501" to 1.5100"

QUICK GO/NOGO CHECKING

When you want to check parts quickly, Progressive Plug Gages are your best choice. Because both the Go and NoGo diameters are stepped on a single gage member, you can inspect parts in one operation. Members are securely attached to either a taperlock handle or trilock handle with mounting bolts. Custom Plug Gage assemblies can be marked with your tool number. Go/NoGo assemblies include 1 line (up to 25 characters) of custom marking. These Progressive Plug Gages are available up to 1.5100" in most class tolerances to meet your unique requirements.

Custom Steel & Chrome Ring Gages from .0600" to 12.2600"

FOR MASTERS & GO/NOGO GAGING

These Ring Gages are perfect for use as masters for bore gages and internal micrometers. Use Vermont Gage Ring Gages to efficiently inspect external dimensions of manufactured parts. With a Go and NoGo ring, an inspector can quickly pass/fail parts without taking time consuming readings from an indicator. These Ring Gages are also perfect for use as masters for bore gages and internal micrometers. By using a same size Master Ring Gage, you eliminate lead error when making measurements. A Certificate of Accuracy accompanies every ring gage assuring size.

Custom Carbide Ring Gages from .0600" to 1.5100"

FOR MASTERS & GO/NOGO GAGING

These Ring Gages are perfect for use as masters for bore gages and internal micrometers. Use Vermont Gage Ring Gages to efficiently inspect external dimensions of manufactured parts. With a Go and NoGo ring, an inspector can quickly pass/fail parts without taking time consuming readings from an indicator. These ring gages are also perfect for use as masters for bore gages and internal micrometers. By using a same size master ring gage, you eliminate lead error when making measurements. A Certificate of Accuracy accompanies every ring gage assuring size.

Standard Flexible Hole Location Gages

Hole Location Plugs are used to measure the location of a threaded hole in a product, typically with a CMM.

Vermont Gage's Flexible Hole Location Plugs larger than #10 (M5) are slotted at 90 degree increments, while Hole Location Plugs #10 (M5) and smaller are of solid construction with front taper covering the entire product tolerance. Both styles insure positive location on the thread flank regardless of the size of the hole within the product tolerance.

- *For inspecting the location of a threaded hole*
- *Slotted 90 degree design locates positively on flank of parts hole*
- *Sizes #10 (M5) and smaller are of solid construction, with front taper to cover entire product tolerance*
- *Use to determine centerline to centerline distances of threaded holes*
- *Certificate of Accuracy included*

Standard Thread Measuring Wires

CHECK YOUR PITCH DIAMETERS

Vermont Gage Thread Measuring Wires, used together with a micrometer, are used to quickly and accurately measure pitch diameters of external threads. They are perfect for calibrating or checking wear on thread plug gages, and can be used to monitor and control pitch diameters of manufactured threads.

- **Tolerance (+/- .000010") of calibrated nominal diameter (+/- .000020") of nominal best wire diameter**
- **Tool Steel; 59/64 Rc**
- **2" long**
- **2 microinch finish**
- **Within .00001" round**
- **100% inspected**
- **ASME B89.1.17**
- **Certificate of Accuracy included**

Basic 60° Thread Measuring Wire Information

Pitch Diameter = Measurement over wires (MOW) - constant

w = wire size

Pitch (P) = 1/number of threads per inch. This is the distance the thread travels in one turn.

$$\text{Constant (C)} = (3 * w) - (.86602540 * P)$$

Pitch Diameter (PD) is the halfway point between sharp major and minor diameters.

$$\text{Measured PD} = \text{MOW} - (3 * w) - (.86602540 * P)$$

Class ZZ Set & Library Calibrations

PIN GAGE SET CALIBRATIONS

Vermont Gage is pleased to offer Calibration Services for pin gage sets. This service is available for both new and used gage sets.

Your calibration readings are taken using a laser micrometer. The published repeatability specification for our lab micrometer is +/- .000005". Traceable to NIST through SI units.

Your gages are inspected per **ANSI/ASME B89.1.5**. Refer to paragraph 6.1.7 – **Recalibration of .0025/.005mm (.0001/.0002 in.) Pins or Pin Sets**.

"Due to typical usage and economics, recalibration of .0025/.005mm (.0001/.0002 in.) tolerance pins or pin sets requires only two measurements, 6.35mm (1/4") from each end, unless otherwise specified."

All gage readings along with size nominals are printed on a single gage set calibration. A pass/fail marker is also printed to quickly identify the status of each gage.

- **New and used gage set calibrations**
- **Laser precision measurements**
- **2) 4-place readings on Inch Sets**
- **2) 3-place readings on Metric Sets**
- **Pass/Fail Marker for each gage**
- **1 Calibration Certificate**
- **NIST traceable**
- **Competitive prices**

Measurement Conflict Resolution

VERMONT GAGE HAS ADOPTED THE MEASUREMENT DISPUTE RESOLUTION METHODS ENDORSED BY THE AMTMA.

"Disputes over measurements can be costly for both parties to resolve and may hinder ongoing relations between suppliers and users of gages and instruments. Often it is simpler for both parties to agree to accept an average value of their readings as the final 'size' or the point at which their readings plus measurements uncertainties overlap.

The obvious way to avoid such problems is to agree beforehand on a method that will be used to resolve them if they arise. Often, the degree of separation between the readings dictate the best approach to take. Where the uncertainty of each party is significantly different, the party with the lowest uncertainty in the calibration would be considered more reliable.

The AMTMA offers the following methods as options you can choose from. If the Referee Method fails to bring a resolution, then the Universal Standard Method should be used due to the fact it is technically based and internationally accepted by metrologists in all disciplines."

THE REFEREE METHOD

The two parties agree on a third party to provide a referee measurement that it is agreed will be considered as the actual value. An alternative on this is where the reading by either party that is closest to that provided by the referee is considered the acceptable value.

Other variations of this method include averaging the readings of three or more laboratories and may also include the readings produced by the parties to the dispute.

Unless otherwise agreed to, the cost of using outside laboratories in this method are paid by the losing party.

THE UNIVERSAL STANDARD METHOD

National and international standards agencies have produced methods of resolving measurement disputes that focus on the uncertainty budgets of those that have produced the measurements. The advantage of this method is that its technical base tends to remove personalities from the equation and may indicate that neither party to a dispute has the capability required to resolve it.

Using this method, the onus of proving a measurement falls on the party that has questioned the results of calibration. If requested, this party must provide a copy of their uncertainty budget for the measurement to the other party for review. Budgets from both parties should be compared. Such a review should focus on seeking agreement between both parties respecting each element included in the budget since it will rarely, if ever, be all right or all wrong. The mathematics should take care of the rest. There may be cases where one or more elements have not been included in the budget and when they are, the outcome changes significantly.

In the event one or more assumptions in the budget cannot be resolved, a third party can be asked to provide an opinion on them."

Gage Fact Sheet

What are Gages used for?

Fixed limit gages are primarily used to check dimensions and geometries; plug gages check internal and ring gages external dimensions and geometries. They effectively ensure that a part being measured is within its designed tolerance limits. Fixed limit gages are highly accurate, economical and easy to use.

Principles of Go/NoGo Gaging

To use as a "Go/NoGo" functional check, try and fit both the "Go" and "NoGo" gages into or onto a part being measured. The measured part passes if the "Go" gage fits and the "NoGo" doesn't, otherwise the part fails. A "Go/NoGo" check is strictly a pass/fail test. The actual part size is never measured.

Types of Fixed Limit Gages

Plug gages are available in two types, plain cylindrical and thread, and in several popular styles: reversible, taperlock and trilock. Style is usually determined by the size of the gage. Ring gages are also available as plain cylindrical and thread type gages.

Wear Resistance and Tolerance

Gages are available in tool steel, Black Guard™, chrome plate, and carbide. Chrome plate and carbide are harder and therefore provide additional wear resistance. A choice of tolerance is also available. See chart for explanation of Gagemaker's tolerances.

Calculate Gage Tolerance

Normal practice for determining gage tolerance is to allow 10% of product tolerance to be divided between the "Go" and "NoGo"

gages. For plug gages "Go" is normally a plus tolerance and "NoGo" a minus tolerance. For ring gages the opposite is true; "Go" is normally a minus tolerance and "NoGo" a plus tolerance.

Using this practice as a guideline, gage tolerance is always included in the part tolerance and accounts for up to 10%. This means that 10% of good product could potentially fail the inspection but that no bad product would ever pass!

Care and Use of Gages

- 1.) Dimensions to be gaged must be cleaned and free from burrs to prevent gaging interference.
- 2.) Gage should be turned slowly into or onto the part being checked. The fit should be snug but not forced. Air flats on a "Go" gage can facilitate the inspection of blind holes where air pressure is a problem.
- 3.) Temperature of the gage and the part should be the same. This is because of the effects of thermal

expansion on material. The normal temperature at which gages are calibrated is 68 degrees Fahrenheit. This is therefore the best temperature at which both part and gage should be when inspected. This effectively eliminates any error due to thermal expansion.

- 4.) Gages should be protected from exposure to excessive heat, moisture, and corrosive chemicals. After use, gages should be cleaned and then coated with a thin-film rust preventative and stored properly.
- 5.) Gages should be periodically calibrated to ensure accuracy. Gages and "Go" gages in particular, will wear with normal use and require recalibration. Frequency of calibration is dependent on such factors as frequency of use, part abrasiveness, tolerance, and applicable quality procedures. All gages should be monitored and maintained accordingly.
