

Erosion & Contamination

Careful attention is always paid to not contaminate water sources from soil erosion during projects and renovations. Erosion control measures such as silt fence, jute matting and erosion mulch are always used. New areas are never left bare longer than needed and once seeded, are immediately covered with straw mulch or hydro-seed mulch. Large, storage bins were created out of concrete blocks on top of an asphalt pad. These storage bins are for keeping large quantities of sand, loam, stone and mulch onsite and they ensure that in heavy rains, these materials will not find their way off the pad or more importantly, into waterbodies.
