

## PASS Theory and CAS2 Information

### PASS Theory of Intelligence and the CAS2

JACK A. NAGLIERI & TULIO R. OTERO

Download Free E-Book

The goal of this e-book is to describe the context in which the PASS Theory of Intelligence was conceived and explain why it got lost the construction of the Cognitive Assessment System and its various versions, and the second edition.

Neurodiversity Podcast

## The WHY behind What I Learned

- I will explain how my study of psychology shaped my view of the concept of intelligence and the tests we use to measure it.
- My emphasis has always been to rely on the research evidence — **the science**
- My goal: improve outcomes for the students
- Today I ask that you look closely at the science I will share and reflect on how **WE CAN DO BETTER** for the students we are trying to help.
- As Charles Barrett says: It's all about the kids!

## What I Learned – The BIG Picture

- The comprehensive assessments we provide alter the course of a student's life; making this one of the most important tasks we have.
- We need intellectual assessment that
  - Informs teachers and students about academic strengths & weaknesses and interventions
  - Helps us understand cognitive variability and diagnosis is SLD, ADHD, ID, etc.
  - Helps us understand WHY a student fails
  - Is fair for students from diverse populations
- These goals can be achieved if we use second-generation tests that measure the way students **THINK to LEARN**
  - The definition of **THINKING** should be based on BRAIN function
  - PASS theory is a way of defining **THINKING** and the Cognitive Assessment System-2<sup>nd</sup> Edition measures a student's neurocognitive abilities

## What I Learned

### My Professional Journey

- I Learned About Traditional Intelligence Tests

### A Theory Based on Brain Function

- I Learned a New Way to Measure Intelligence

### From PASS to CAS2

- I Learned the Power of PASS

### Research Update

- I Learned the Science of Intelligence Testing

## Introduction

- Teaching guitar made me wonder about learning
- Interest in intelligence and instruction

## Getting Started in School Psychology

- In 1972 I learned about A. R. Luria in my Neuropsychology of Learning Disabilities course.

- Luria's neuropsychological work was gaining international attention

- As much as I liked Luria's description of brain function there was no way to measure his concepts of the functional units so what did I do?

1970

1973

## Traditional IQ and Achievement Tests

- Working as a school psychologist in 1975 I used the WISC
- I noticed that items on the WISC we were VERY similar to items on the achievement test
  - General Information, Vocabulary and Arithmetic subtests JUST LIKE THE WISC!
  - **THAT DID NOT MAKE SENSE**
  - I applied to Ph.D. programs

1975 Charles Champagne Elementary, Bethpage, NY

## A Pivotal Event That Changed my Life

1976

1977

2022

11

---

---

---

---

---

---

---

---

## 1977-1979 University of Georgia

- I worked with the Kaufmans to develop the KABC using the research described by Das, et al book 
- Kaufman suggested that the Verbal scale of the WISC-R could be conceptualized as **achievement**
- I reviewed Mercer's book *Labeling the Mentally Retarded* (1973)
  - She stated that intelligence tests should **measure the processes involved in learning** rather than culture specific **accumulation of knowledge**. 
- In 1978 I wrote that "A test of intellectual ability based upon a theory of processing rather than acquired knowledge may prove to be the next step toward improved assessment of intelligence." Feb 11, 1984

12

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

**1981**

**Test Results and Interpretations:**

On the WISC-R, Amanda earned a **performance IQ of 36.7** which falls in the average range of intelligence for 21- and 22-year-olds. In comparison to the children her age in the standardization sample, **in contrast** to this score of average non-verbal intelligence was her **Verbal IQ of 10.7**. This score is quite low and indicates that her level of **fluency with the English language falls at about the 1st percentile rank**. **This score can not be considered an estimate of verbal intelligence because Amanda speaks mostly Supai and little English. Due to the large difference between these scores, no full Scale IQ was computed.**

With the WISC-R, clear patterns emerged. Amanda performed well on tasks that required little or no English language comprehension or expression, and poorly on all tasks which did require these linguistic skills. In fact, even if a task was visual and non-verbal, but required English language comprehension of instructions, she performed more poorly.

**WISC-R RECORD FORM**

**WISC-V Full Scale**

**Naglieri, J. A. (1982). Does the WISC-R measure verbal intelligence for non-English speaking children? Psychology in the Schools, 19, 478-479.**

---

---

---

---

---

---

---

---

---

---

**What I Learned- Measure Thinking**

This research convinces me that measuring intelligence using test questions that measured how well a student can think was a valid and equitable way to measure general intelligence 'g'.

**Research on Six Versions of the Naglieri Nonverbal Tests**

Each of these versions of the NNAT showed similar scores by RACE, ETHNICITY, & SEX and had strong correlation with achievement

**MAT** (Measures of Academic Progress Test) - 1985  
**MMAT** (Measures of Mental Ability Test) - 1987  
**NNAT** (Nonverbal Nonverbal Ability Test) - 2003  
**NNAT-2** (Nonverbal Nonverbal Ability Test-2) - 2008  
**NNAT3** (Nonverbal Nonverbal Ability Test-3) - 2016

---

---

---

---

---

---

---

---

---

---

My research on the NNAT led me to realize that we should measure **Thinking** not knowing

My career as a test developer began with this goal and the Matrix Analogies Test

---

---

---

---

---

---

---

---

### Tests that Measure Thinking or Knowing?

Girl is woman as  
boy is to **man**?

3 is to 9 as  
4 is to **16**?

C<sup>7</sup> is to F as  
E<sup>7</sup> is to **A**?

---

---

---

---

## Why do we measure intelligence the way we do?

The History of IQ tests

---

---

---

---

---

---

---

---

Binet → Stanford-Binet → Army Mental Tests → WISC, CogAT, Olsat

20

---

---

---

---

---

---

---

---

## Alpha & Beta → Wechsler

21

---

---

---

---

---

---

---

---

## Wechsler's View of General ability

- Wechsler "believed that his Verbal and Performance Scales represented different ways to access *g* (general ability)", but he **never believed [in verbal and] nonverbal intelligence as being separate from *g***. Rather he saw the Performance Scale as the most sensible way to measure the general intelligence of people with ... limited proficiency in English. (Kaufman, 2008)

"The aggregate or global capacity of the individual to act purposefully, to think rationally, and to deal effectively with his environment (1939)"

## Pintner (Intelligence Testing, 1923)

CONCEPT OF GENERAL INTELLIGENCE. by  
The criteria of a Test of Intelligence... followed  
by the theoretical discussion of general intelligence  
and by the empirical study of testing, we have arrived  
at certain requirements for a good test of intelligence,  
which we may discuss under the four following headings:

1. From these requirements it is plain that a good intelligence  
test must be so made as to measure something that is  
essentially learned by the subjects tested. In a broad  
sense this means a differentiation between learned  
and unlearned. To use as a test of intelligence  
something that is essentially taught is unfair to the  
subject, because those differing who have received the  
particular grade to which this is generally taught have  
learned this fact, whereas other children or adults  
of general intelligence may have had no opportunity to  
learn this same fact, simply because they may not have  
reached this particular grade in their school work. To  
test the question, "Who observed Newton?" is a  
measure of the subject's general learning, not  
intelligence. Failure to answer might result from the  
lack of intelligence in the case of school children of a  
certain grade to which this fact had been a matter of in-  
struction, but on the other hand a very intelligent child  
might fail to answer owing to the fact of his not having  
reached the grade to which this fact was taught.

- This is a social justice issue for those from disadvantaged communities and those with limited education

## Academic Learning Loss & COVID

- COVID-19 has increased the impact of disparities in access and opportunity for students of color and they are even further behind than they were before.
- Their **scores on traditional intelligence tests** which demand knowledge **can be inaccurate**.
- Solutions:**
  - For traditional tests, use post-COVID norms only.
  - Use intelligence tests that are not dependent upon knowledge

Education in a Pandemic: The Disparate Impacts of COVID-19 on America's Students. US Dept. of Ed.-Office of Civil Rights. June, 21, 2021. <https://www2.ed.gov/about/offices/list/ocr/docs/20210608impacts-of-covid-19.p>

24

---

---

---

---

---

---

---

---

### What is the Practical Impact of intelligence tests that are confounded by knowledge?

25

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

Naglieri, J.A., & Rahn, J. (2001). Intellectual classification of Black and White children in special education programs using the WISC-III and the Cognitive Assessment System. *American Journal on Mental Retardation*, 106(4), 359-367.

**Intellectual Classification of Black and White Children in Special Education Programs Using the WISC-III and the Cognitive Assessment System**

Jack A. Naglieri  
Jennifer Rahn  
University of North Carolina at Charlotte

White children earned similar scores on the Verbal and Performance scales.  
Black children earned lower VIQ than PIQ scores → low Full Scale.  
Black children earned higher Full Scale scores on CAS than whites.  
Fewer Black children would be identified as intellectual disability based on Full Scale scores using CAS than WISC-III.

## CASE by Tulio Otero: ALEJANDRO (CA, 7-0 GRADE 1)

### REASON FOR REFERRAL

- Does he have ID?
- Academic:
  - Could not identify letters/sounds
  - October, could only count to 39
  - AI/ACCESS scores of 1
- Behavior:
  - Difficulty following directions
  - Attention concerns
  - Refusal/defiance

Note: this not captured legend o

## Alejandro and PASS (by Dr. Otero)

- Alejandro is not a slow learner
- He has good processing scores:
  - Simultaneous = 96 and Planning = 102
- He has a "disorder in one or more of the basic psychological processes"
  - Attention = 67 and Successive = 84
- Using the **Discrepancy Consistency Method** (1999, 2017) he meets criteria for SLD (see Naglieri & Otero, 2017).
- Evidence of Dyslexia (low Successive) and Inattentive Type of ADHD (low Attention)

The Consistency portion of the triangle answers the question: "Why does the student fail?"

I Learned that we  
should Measure  
Thinking  
not knowing

---

---

---

---

---

---

---

Take a few minutes to...

- Talk with your colleagues
- How do you feel about separating thinking from knowing?
- Is it hard to reconceptualize subtests like Vocabulary and Similarities and others like those as knowledge not intelligence?
- Is there a counter argument?

---

---

---

---

---

---

---

How Can we Test  
my Hypothesis  
that Knowledge  
Confounds the  
Measurement of  
General  
Intelligence?

Create general  
intelligence tests that  
include verbal and  
quantitative content  
but do not rely on  
academic knowledge!

---

---

---

---

---

---

---

## Measuring General Ability Using the Naglieri General Ability Tests: Verbal, Nonverbal and Quantitative (Naglieri, Brulles & Lansdowne, 2022)

Jack A. Naglieri, Ph.D. [jnaglieri@gmail.com](mailto:jnaglieri@gmail.com)  
 Dina Brulles, Ph.D. [dbrulles@gmail.com](mailto:dbrulles@gmail.com)  
 Kim Lansdowne, Ph.D. [Kimberly.Lansdowne@asu.edu](mailto:Kimberly.Lansdowne@asu.edu)

---

---

---

---

---

---

---

---

### Naglieri General Ability Tests

- We **explicitly made tests for accurate identification** of students from diverse cultural, linguistic, or socioeconomic backgrounds
- We used the traditional Verbal, Nonverbal and Quantitative formats to **measure general ability** and to ensure equity we used:
  - Test questions that do not require academic knowledge,
  - Verbal and Quantitative test questions that can be solved using any language,
  - Animated instructions remove the need for comprehension of directions,
  - A multiple-choice response removes the need for verbal expression.
  - Universal assessment using local and national norms
  - Confirmatory factor analysis supported the measurement of general ability.

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

## Naglieri General Ability Test – Verbal (Naglieri & Brulles, 2022)

The **Naglieri-V** measures general ability using pictures of objects representing verbal concepts. The items are comprised of universally recognized pictures that do not rely on knowledge acquired in academic settings.

The student's task is to identify which of the six pictures does not represent the verbal concept shared by the other five.

The test items require close examination of the relationships among the pictures.

**Naglieri** Verbal

---

---

---

6<sup>th</sup> Gr.

Hard

**Naglieri** Verbal

---

---

---

---

---

---

---

---

## Naglieri General Ability Test - Nonverbal (Naglieri, 2022)

The **Naglieri-NV** measures general ability using questions that require a student to recognize the relationships among the shapes.

The structure of the items varies, but all items require that the student decipher the logic behind the relationships among the shapes, sequences, spatial orientations, patterns, and other distinguishing characteristics.

This nonverbal test is conceptually similar to the NNAT3 but it contains many NEW kinds of items not included before.

---

---

Naglieri General Ability Test – Quantitative  
(Naglieri & Lansdowne)

The Naglieri-Q measures general ability using numbers and/or symbols. Students must decipher the logic behind the relationships among the numbers and symbols to identify the answer.

Items require the student to determine equivalency of simple quantities, analyze a matrix of numbers and solve mathematical sequences.

Items require minimal academic knowledge, and the calculation requirements are simple.

The items have no verbal requirements (i.e., no math word problems) so that they can be solved regardless of the language used by the student.

## Urban and Suburban Childrens' Performance on the Naglieri Verbal, Nonverbal and Quantitative General Ability Tests

Naglieri, Famus & Brulles (submitted for publication, July 2025)

**Abstract**  
The purpose of this study was to examine general intelligence test scores among children in urban and suburban settings using the Naglieri General Ability Tests: Verbal, Nonverbal, and Quantitative (Naglieri, Brulles, & Lansdowne, 2021). The two samples included children aged 4-17 years who were closely matched to the U.S. population based on gender, race, ethnicity, geographic region, and parental education level. Few differences were found on preliminary analyses of the Naglieri General Ability Tests—Verbal (Naglieri & Brulles, 2021;  $N = 2,078$ ), Nonverbal (Naglieri, 2021;  $N = 1,665$ ), and Quantitative (Naglieri & Lansdowne, 2021;  $N = 1,974$ ). These findings suggest that this approach to measuring general ability may have utility for more equitable identification of students from diverse backgrounds for possible inclusion in gifted education programs.

## POST COVID National Norms

National Norms 1,000 students pre grade (K to grade 5).

Table 1. National Norm Sample Characteristics.

| Demographic                |           | N     | %     | U.S. Census (%) |
|----------------------------|-----------|-------|-------|-----------------|
| Race/Ethnicity             | Asian     | 235   | 3.9   | 4.7             |
|                            | Black     | 919   | 15.3  | 12.9            |
|                            | Hispanic  | 1,261 | 21.0  | 23.3            |
|                            | White     | 2,914 | 48.6  | 46.1            |
|                            | Other     | 671   | 11.2  | 12.9            |
|                            |           |       |       |                 |
| U.S. Region                | Northeast | 804   | 13.4  | 15.9            |
|                            | Midwest   | 1,270 | 21.2  | 20.2            |
|                            | South     | 2,328 | 38.8  | 38.1            |
|                            | West      | 1,598 | 26.6  | 25.7            |
| Total National Norm Sample |           | 6,000 | 100.0 |                 |

## Diversity and Inclusion Solution – PreK-12

Naglieri General Ability Tests

Author, Speaker, or Consultant of the Year

Dr. Jack Naglieri, Dr. Jene Brulles, and Dr. Kimberly Lansdowne

I Learned  
that verbal, nonverbal and  
quantitative tests of  
general ability that do not  
demand academic  
knowledge can identify  
students who are very  
smart but may not be  
academically advanced

---

---

---

---

---

---

---

---

Using group  
and  
individually  
administered  
tests for Gifted  
Identification  
can be tricky

- Use the Three Naglieri General Ability Tests: Verbal, Nonverbal and Quantitative for **UNIVERSAL ASSESSMENT** to identify the students with very high scores
- Use national or local norms to identify students who meet the cutoff score
- **INDIVIDUAL ASSESSMENT** by the school psychologist must include an intelligence test that measures THINKING (g) not KNOWING (CAS2)

56

---

## What I Learned

From: *Essentials of CAS2  
Assessment*, Naglieri & Otero,  
2017

### My Professional Journey

- I Learned About Traditional Intelligence Tests

### A Theory Based on Brain Function

- I Learned a New Way to Measure Intelligence

### From PASS to CAS2

- I Learned the Power of PASS

### Research Update

- I Learned the Science of Intelligence Testing

---

---

---

---

---

---

---

---

## Intelligence as Neurocognitive Functions

- In my first working meeting with JP Das (February 11, 1984) we proposed that intelligence was better REinvented as neurocognitive processes and we began development of the Cognitive Assessment System (Naglieri & Das, 1997).
- We conceptualized intelligence as Planning, Attention, Simultaneous, and Successive (PASS) neurocognitive processes based on Luria's concepts of brain function.

---

---

---

---

---

---

---

---

## PASS Neurocognitive Theory

- **P**lanning = The THINKING used to figure out how to do something
  - **A**ttention = The THINKING used to focus and resist distractions
  - **S**imultaneous = The THINKING used to understand how things are interrelated
  - **S**uccessive = The THINKING used to work with information in a specific order
- PASS** = 'basic psychological processes'
- NOTE: Easy to understand concepts!

61

---

---

---

---

---

---

---

---

I Learned the Importance of having a Theory based on brain function

---

---

---

---

---

---

---

---

## PASS Theory: Four Ways of Thinking

| Planning   | Attention                                                                                                  | Simultaneous     | Successive                                          |
|------------|------------------------------------------------------------------------------------------------------------|------------------|-----------------------------------------------------|
|            | <div>BLUE RED</div> <div>RED RED</div> <div>YELLOW YELLOW</div> <div>BLUE BLUE</div> <div>YELLOW RED</div> |                  | <div>4 3 8 6 1</div> <div>Follow the sequence</div> |
| Use a PLAN | Focus & Resist Distraction                                                                                 | See the Patterns |                                                     |

62

---

---

---

---

---

---

---

---

## PASS constructs are easy to explain, especially to the students

The first step in the PASS intervention Protocol is to explain the four PASS processes to the STUDENT

---

---

---

---

---

---

---

---

### PASS is Easy to Explain

This is not a picture of Frankie

- Frankie was struggling in school at age 11
- Referred by parents after a history of reading and self esteem problems
- High level of anxiety
  - he was too anxious to look closely at the words
  - he rushed to get tasks completed
- Frankie could not attend to the details of the sequence of letters for correct spelling, and the order of sound-symbol associations

Figure 3.6 Frankie with anxiety

65

---

---

---

---

---

---

---

---

### Frankie's Discrepancy Consistency Results

66

---

---

---

---

---

---

---

---

### Frankie: in 1999

- I informed Frankie of his PASS scores, and everything changed
- He learned to manage his attention problem by using good Planning which helped him
  - recognize when he is off task
  - Think of possible ways to manage his attention
  - recognize when he needed a change in the environment to reduce distractions
- Perhaps most importantly: He was given hope – that he could succeed

### 25 Years later (2024)

- Frankie graduated High School and went to college
- Is married with children
- He is a graphic designer
- He uses his good Planning, Simultaneous and Successive processing to manage any obstacles he may still have with attention

67

---

---

---

---

---

---

---

---

### Intervention Protocol (Kryza & Naglieri)

- Explain PASS scores to the students:
  - For example: The part of your brain that makes learning challenging for you is the part that PLANS (PFC).
  - We're going to work on using your strength(s) so you can do better.
- Give STUDENTS the PASS handouts
  - For example: *"The test showed that your brain is strong in seeing the BIG PICTURE (Simultaneous Processing) and recognizing sequences. (Successive Processing) Does that make sense to you?"*
  - *YOU CAN do better if you THINK SMART and use your strengths to manage what is hard for you.*

## PASS Theory Based on Brain Function – Planning, Attention, Simultaneous and Successive Neurocognitive processes

Figure 1.2 Three Functional Units and Associated Brain Structures  
From: *Essentials of CAS2 Assessment*. Naglieri & Otero, 2017

[illegible]

## PASS Theory: Planning

- Planning is a term used to describe a neurocognitive function similar to metacognition and executive function
- Planning is needed for setting goals, making decisions, predicting the outcome of one's own and others actions, impulse control, strategy use and retrieval of knowledge
- Planning refers to **THINKING ABOUT HOW TO SOLVE ANY KIND OF A PROBLEM** from academics to social situations and life in general
- Math calculation, written expression, etc

---

### 25 Years Later Planning is the Key to Success

---

---

---

---

---

---

---

---

## A 13 month old's Plan At 19 months Planning & Knowledge

72

## Planning Learning Curves

- Learning depends upon many factors especially PASS
- When a task is practiced and learned it requires less thinking (PASS) and becomes a skill
- At first, PASS plays a major role in learning

Note: A skill is the ability to do something well with minimal effort (thinking)

80

## Planning (EF) and Skills

- Given that **Planning (EF) demands intentionality**, that means that planning processing is something that occurs over time and with effort.
- **Skills** are things we do with very little thinking. Automatic actions do not afford the time for thinking (planning) but rather immediate responding.
- Therefore, Planning and EF should not be described as 'skills'
- Your thoughts?

### The case of Rocky

- ▶ Rocky<sup>1</sup> went to school in a large middle-class district
- ▶ In first grade Rocky was significantly below grade benchmarks in reading, math, and writing.
  - He received group reading instruction weekly and six months of individual reading instruction but minimal progress → retained
- ▶ By the middle of his second year in first grade he still struggling
  - decoding, phonics, and sight word vocabulary; math problems, addition, problem solving activities and focusing and paying attention.
- ▶ After two years of special team meetings and special reading instruction he is now working two grade levels below his peers in reading, writing, and math

Note: This child's name and other potentially revealing data have been changed to protect his identity.

### Discrepancy Consistency Method for SLD Determination

Naglieri & Otero (2017) Pattern of Strengths and Weaknesses

Essentials of CAS2 Assessment

### this IS A *Strength Based Method*

Knowing a student's GOOD scores is just as important as knowing their LOW scores

Naglieri, J.A. (n.d.). CAS2, CAS2 Brief, CAS2 Rating Scale Analyzer (Excel tools). JackNaglieri.com. <https://jacknaglieri.com/pass-score-analyzers>

---

---

---

---

---

---

---

---

### Answering the Question: Why the student fails?

- The Discrepancy Consistency Method (DCM) was first introduced in 1999 (most recently in 2017)

Naglieri, J.A. (n.d.). CAS2, CAS2 Brief, CAS2 Rating Scale Analyzer [Excel tools]. JackNaglieri.com. <https://jacknaglieri.com/pass-score-analyzers>

### Interventions for Rocky

#### Using Plans to Overcome Anxiety

Some children feel very anxious when they approach a new situation, and they are not sure what

#### Graphic Organizers for Connecting and Remembering Information

Remembering and making information is a common part of learning and daily life. Students are often expected to learn large amounts of new and unfamiliar information. Learning tasks require

#### Segmenting Words for Reading/Decoding and Spelling

Decoding a written word requires the person to make sense out of printed letters and words and to understand the meaning of the words. This involves understanding the sounds that letters

#### Chunking for Reading/Decoding

Reading/decoding requires the student to look at the sequence of the letters in words and understand the organization of specific sounds in order. Some students have difficulty with long sequences of letters and may benefit from instruction that helps them break the word into smaller, more manageable units, called chunks. Sometimes the order of the sounds in a word is most important.

### A Cognitive Strategy Instruction to Improve Math Calculation for Children With ADHD and LD: A Randomized Controlled Study

Jackie S. Iseman<sup>1</sup> and Jack A. Naglieri<sup>1</sup>

#### Abstract

The authors examined the effectiveness of cognitive strategy instruction based on PASS (Planning, Attention, Simultaneous, Successive) given by special education teachers to students with ADHD randomly assigned by classroom. Students in the experimental group were assigned to a brief cognitive strategy instruction for 10 days, which was designed to encourage

test the comparison group received no instruction. All standardized achievement tests (Woodcock-Johnson Achievement Test, Second Edition, etc.) were also administered at 1 year up but not the comparison group on tests (0.49 and -0.14, respectively) in group. These findings suggest that help to standardized tests of math and continued advantage 1 year later

#### Planning Facilitation for Math Calculation

Math calculation is a complex activity that involves recalling basic math facts, following procedures, working carefully, and checking one's work. Math calculation requires a careful (i.e., planful) approach to follow all of the necessary steps. Children who are good at math calculation can move on to more difficult math concepts and problem solving with greater ease than those who are having problems in this area. For children who have trouble with math calculation, a technique that helps them approach the task planfully is likely to be useful. Planning facilitation is such a technique.

## Instructional Sessions

- Math lessons were organized into "instructional sessions" delivered over 13 consecutive days
- Each instructional session was 30-40 minutes
- Each instructional session was comprised of three segments as shown below

| 10 minutes               | 10-20 minutes                               | 10 minutes               |
|--------------------------|---------------------------------------------|--------------------------|
| 10 minute math worksheet | Planning Facilitation or Normal Instruction | 10 minute math worksheet |

### Experimental Group

19 worksheets with Planning Facilitation

vs.

### Control Group

19 worksheets with Normal Instruction

88

---

---

---

---

---

---

---

---

## Planning Facilitation: Asking vs. Telling

- Teachers facilitated discussions to help students become more self-reflective about use of strategies
- Teachers asked questions like:
  - What was your goal?
  - Where did you start the worksheet?
  - What strategies did you use?
  - How did the strategy help you reach your goal?
  - What will you do again next time?
  - What other strategies will you use next time?

© 2010 by the University of Michigan

89

---

---

---

---

---

---

---

---

## Student Comments During Planning Facilitation

- My goal was to do all of the easy problems on every page first, then do the others.
- I do the problems I know, then I check my work.
- The problems that have more steps take more time, so I skip them
- I did all the problems in the brain-dead zone first.

### PASS Theory: Attention

- Attention is a basic psychological process we use to
  - **THINKING THAT INVOLVES ATTENDING AND RESISTING DISTRACTION**
  - Selectively attend to some stimuli and ignoring others
  - Focus our cognitive activity
  - Selective attention
  - Resistance to distraction
  - Listening, as opposed to hearing

56

---

---

---

---

---

---

---

---

## Attention Subtests

## Expressive Attention

## Number Detection

|                                           |
|-------------------------------------------|
| Find the numbers that look like this: 1 2 |
| 1 5 1 4 2 2 5                             |

## Receptive Attention

|    |    |    |
|----|----|----|
| Nn | Tr | bt |
| TR | nb | Aa |

## Priming the Examinee on Attention Tests

- First, we ask the students to the numbers 1 2 among about 200 numbers on the page

Find the numbers that look like this: 1 2

|   |   |   |   |   |   |   |   |   |   |   |   |
|---|---|---|---|---|---|---|---|---|---|---|---|
| 5 | 2 | 1 | 2 | 3 | 1 | 4 | 3 | 6 | 3 | 3 | 4 |
| 5 | 2 | 1 | 1 | 4 | 6 | 6 | 4 | 4 | 6 | 1 | 5 |
| 4 | 5 | 6 | 3 | 2 | 4 | 4 | 6 | 6 | 3 | 3 | 6 |

- Then we ask the students to find  
1 2 5 6
- This is how we measure Resistance to distraction and focused attention

Find the numbers that look like this: 1 2 5 6

|   |   |   |   |   |   |   |   |   |   |   |   |
|---|---|---|---|---|---|---|---|---|---|---|---|
| 4 | 3 | 1 | 5 | 1 | 4 | 2 | 2 | 5 | 1 | 3 | 4 |
| 1 | 4 | 2 | 6 | 3 | 6 | 3 | 5 | 3 | 5 | 3 | 6 |
| 2 | 4 | 1 | 3 | 2 | 2 | 3 | 3 | 1 | 2 | 4 |   |

Jose: Age 10, 5<sup>th</sup> Grade,  
Bilingual Student  
by Tulio M. Otero, Ph.D.

Jose reading problems and the teacher these concerns:

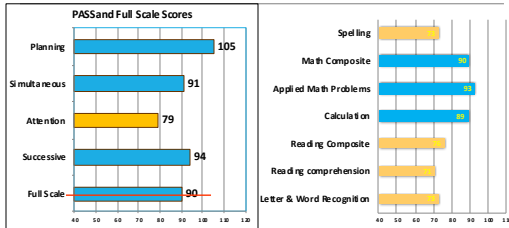

phonemic awareness, reading fluency, reading comprehension, math problem-solving, spelling, written expression

Jose also receives ELL services and his current ACCESS scores are as follows: Listening 5.8, Speaking 1.9, Reading 2.8, Writing 3.5.

2018 WISC4 Spanish :

## Case of Alexandra (Tulio Otero)

- Alex is 8-years-old in the 3rd grade.
- Her home language is primarily Spanish, although she speaks English with siblings.
- Alex has difficulty when encountering most reading and written language tasks.
- Alex was previously evaluated for special education.
  - The test results indicated her overall cognitive abilities were in the Low Average range (WISC).
  - Significant difficulty with reading fluency and automatic word recognition skills.
  - Has strong decoding and phonological skills.
  - Spanish literacy achievement results in word reading and spelling fell within the Average range.
  - Her struggles were ascribed to attention problems stemming from ADHD and not a specific learning disability.
- She continues to have significant reading and writing difficulties, limited self-confidence, and struggles to complete her work.

136

## Case of Alexandra (orthographic)

137

## Case of Alexandra - SLD

138

## Be Intentional and Transparent

### ➤ Give Alex the PASS handouts

- *"The test showed that your brain is strong in seeing the BIG PICTURE (Simultaneous Processing) and Recognizing strategies to use. (Planning Processing) Does that make sense to you?"*

### ➤ Explain to him the PASS areas that are challenges for him

- The part of your brain that makes learning challenging for you is the part that helps pay close attention, not get distracted by things around you, and keep all kinds of information in sequence (in order).
- We're going to work on using your strengths and helping you develop more skills.

## PASS Theory Based on Brain Function – Successive Processing

Figure 1.2 Three Functional Units and Associated Brain Structures  
From: Essentials of CAS2 Assessment. Naglieri & Otero, 2017

---

---

---

---

---

---

---

---

## PASS Theory: Successive

➤ **Successive** processing is a basic psychological process we use to manage stimuli in a specific serial order

### ▪ THINKING ABOUT THE SEQUENCE OF THINGS

- Stimuli form a chain-like progression
- Recall a series of words
- Decoding words
- Letter-sound correspondence
- Phonological tasks
- Understanding the syntax of sentences
- Comprehension of written instructions

---

---

---

---

---

---

---

---

## Successive Subtests

### ➤ Word Series - Man Cow Key

### ➤ Visual Digit Span - 4 3 8 6

### ➤ Sentence Repetition (ages 5-7)

- Child repeats sentences exactly as stated by the examiner:

- The red greened the blue with a yellow.*

### ➤ Sentence Questions (ages 8-18)

- Child answers a question about a statement made by the examiner:

- The red greened the blue with a yellow. Who got greened?*

112

---

---

---

---

---

---

---

## Case of Paul: gr. 4 Dyslexia (Steve Feifer)

### ➤ Case of Paul - A 9-year-old in 4<sup>th</sup> grade

- Problems in reading and math
- Can't remember the sequence of steps when doing math and math facts
- Good memory for details
- Can't sound out words
- Poor spelling
- Poor reading comprehension

113

---

---

---

---

---

---

---

---

## Paul - age 9 years

Presenting Concerns: Reading, Math Word Problems, Anxiety

| WISCV                | COMPOSITE SCORE | RANGE         | PERCENTILE RANK |
|----------------------|-----------------|---------------|-----------------|
| Verbal Comprehension | 89              | Below Average | 23%             |
| Visual Spatial       | 84              | Below Average | 14%             |
| Fluid Reasoning      | 82              | Below Average | 12%             |
| Working Memory       | 72              | Very Low      | 3%              |
| Processing Speed     | 76              | Very Low      | 6%              |
| FULL SCALE SCORE     | 81              | Below Average | 10%             |
| WIAT III Reading     | 87              | Below Average | 19%             |
| WIAT III Math        | 90              | Average       | 25%             |
| WIAT III Writing     | 94              | Average       | 34%             |

## What I Learned

Figure 1.2: Four Functional (and Related) Brain Regions  
From: *Essentials of CAS2 Assessment*, Naglieri & Otero, 2017

### My Professional Journey

- I Learned About Traditional Intelligence Tests

### A Theory Based on Brain Function

- I Learned a New Way to Measure Intelligence

### From PASS to CAS2

- I Learned the Power of PASS

### Research Update

- I Learned the Science of Intelligence Testing

What do we know about the latest research on how to interpret the intelligence tests we currently use?

**The research may surprise you !**

12

## Intelligence testing over the last several decades

- We have seen additional scales added to traditional intelligence tests to measure WORKING MEMORY, PROCESSING SPEED, etc.
- What does the science tell us?

13 - 123

Which intelligence test scores have enough specific variance to be interpreted?

There is a scientific way to answer this question

**Bifactor analysis** examines each subtest and scales' correlation with the general factor (g) and what each specific ability factor (subtests and scales) tells us **beyond** the Full Scale.

This method reveals whether subtests and scales should be used to understand intellectual strengths and weaknesses.

---

---

---

---

---

---

---

---

## The Validity of 'g' is Supported

1. WISC-V (Carnegie, et al., 2017)
2. WAIS-IV (Carnegie, et al., 2010)
3. WISC-IV Spanish (McGill & Carnegie, 2017)
4. Canadian WISC-V (Watkins, et al., 2017)
5. Stanford-Binet -Fifth Edition (Carnegie, 2008)
6. Cognitive Abilities Test (Cucina & Byle, 2017)
7. Universal Nonverbal Intelligence Test (Benson, et al., 2020)
8. Differential Ability Scales-Second Edition (Carnegie & McGill, 2016)
9. Woodcock-Johnson IV Cognitive (Domrowski, McGill & Carnegie (2017)
10. Kaufman Assessment Battery for Children-II (McGill & Spurgin, 2017)
11. CHC model based on Carroll's Survey of Factor-Analytic Studies (Benson, et al. 2018)
12. Naglieri General Ability Tests: Verbal, Nonverbal, Quantitative (Naglieri, Bruiles Lansdowne)

**Conclusion: The Full Scale (total) score is a valid representation of general intelligence**

125

---

---

---

---

---

---

---

---

Each of these research studies indicate that the Full Scale score is the *only* score to interpret!

1. WISC-V (Carnegie, et al., 2017)
2. WAIS-IV (Carnegie, et al., 2010)
3. WISC-IV Spanish (McGill & Carnegie, 2017)
4. Canadian WISC-V (Watkins, et al., 2017)
5. Stanford-Binet -Fifth Edition (Carnegie, 2008)
6. Cognitive Abilities Test (Cucina & Byle, 2017)
7. Universal Nonverbal Intelligence Test (Benson, et al., 2020)
8. Differential Ability Scales-Second Edition (Carnegie & McGill, 2016)
9. Woodcock-Johnson IV Cognitive (Domrowski, McGill & Carnegie (2017)
10. Kaufman Assessment Battery for Children-II (McGill & Spurgin, 2017)
11. CHC model - Carroll's Factor-Analytic Studies (Benson, et al. 2018)
12. Reynolds Intellectual Assessment Scales - (Nelson, et al., 2007)

**Conclusion: The subtests and scales "have little-to-no interpretive relevance above and beyond that of general intelligence"**

**Support for 'g' ONLY**

126

22

## Support for PASS Scales

- "...the CAS subtests had less variance apportioned to the higher-order general factor (g) and greater proportions of variance apportioned to first-order (PASS...) factors."
- This is consistent with the subtest selection and construction in an attempt to measure PASS dimensions linked to PASS theory ... and neuropsychological theory (Luria)." (p. 311)

128

### Hierarchical Factor Structure of the Cognitive Assessment System: Variance Partitions From the Schmid-Leiman (1957) Procedure

Gary L. Canivez  
Eastern Illinois University

Orthogonal higher-order factor structure of the Cognitive Assessment System (CAS; Naglieri & Das, 1997a) for the 5-7 and 8-17 age groups in the CAS standardization sample is reported. Following the same procedure as recent studies of other prominent intelligence tests (Dombrowski, Watkins, & Bragan, 2009; Canivez, 2008; Canivez & Watkins, 2010a, 2010b; Nelson & Canivez, 2017; Nelson, Canivez, Lindstrom, & Hart, 2007; Watkins, 2006; Watkins, Wilson, Kott, Carbone, & Bubala, 2006), three- and four-factor CAS exploratory factor structures were analyzed with the Schmid and Leiman (1957) procedure using MacCall (Watkins, 2004) to assess the hierarchical factor structure by sequentially partitioning variance to the second- and first-order dimensions as recommended by Carroll (1980, 1997). Results showed that greater portions of total and common variance were accounted for by the second-order, global factor, but compared to other tests of intelligence CAS subtests measured less second-order variance and greater first-order Planning, Attention, Simultaneous, and Successive (PASS) factor variance.

**Keywords:** CAS, construct validity, hierarchical exploratory factor analysis, Schmid-Leiman, higher-order analysis, structural stability

## Multidimensional Scaling of the Cognitive Assessment System-2

RONALD HAZEL  
University of Illinois at Chicago

Presented at the meeting of the National Association of School Psychologists, Seattle WA 2025. Correspondence concerning this poster should be addressed to Ryan J. McGill, Associate Professor of School Psychology, William & Mary School of Education, P.O. Box 8795, Williamsburg, VA 23187 USA. E-mail: rmcgill@wm.edu

Interpretation of PASS Scores is Supported: "The current study found that indicators were consistently aligned in the way that they are organized in the PASS derived composite scores on the CAS2."

Original Research Article

### Unraveling the Multifaceted Nature of Intelligence: A Correlated Factor Model Approach Grounded in PASS Theory

Timothy C. Papadopoulos<sup>1</sup>, George Spanoudis<sup>1</sup>, Jack A. Naglieri<sup>2</sup>, and Jagannath P. Das<sup>2</sup>

**Abstract**  
Intelligence, a subject of profound interest within psychology, has seen extensive exploration of its psychological and psychometric foundations. This study delves into the multifaceted nature of intelligence, using structural equation modeling techniques to examine theory-driven conceptualizations of the construct. We tested several models, including unidimensional, correlated, higher-order, and bifactor generalizability and generalizability models. To enhance the reliability and generalizability of the findings, we used a large and diverse dataset based on the Planning, Attention, Simultaneous, Successive (PASS) theory and the Cognitive Assessment System 2 (CAS2), which was standardized in the United States. Results showed that the correlated factor model, which reflects relationships among cognitive domains, offers the most fitting representation of intelligence. This outcome aligns with the PASS theory's theoretical foundations, emphasizing intelligence's multifaceted nature. Also, our exploration of cultural relevance reinforces the importance of considering demographic-related differences in cognitive processes. By endorsing a correlated factor model, our study encourages a subtle understanding of intelligence that acknowledges the diversity and interconnectedness of cognitive processes, with potential implications for education and clinical assessment practices.

**Keywords**  
intelligence, dimensionality, hierarchical models

Papadopoulos, Spanoudis, Naglieri and Das (2025) concluded: PASS scores have sufficient specific variance to be interpreted.

Fröst, N., Jansson, B. & Partanen, P. (2025). Construct validity of the Scandinavian version of the Cognitive Assessment System 2<sup>nd</sup> Edition

Manuscript submitted for publication

And the results from the most recent bifactor study on the CAS 2 Digital: PASS scores go beyond g

### Research Findings

This study evaluated the construct validity of the Scandinavian version of the CAS-2 using data from 614 children and adolescents in Sweden and Norway.

The bifactor model supported the multidimensional nature of the CAS-2. That is, **CAS2 is more than g and PASS scores CAN BE INTERPRETED**

The results indicate that the CAS-2 is psychometrically sound for use in Scandinavian contexts

How do we Manage this Research? Your thoughts...

- What if the research is inconsistent with what we know?
- Do we have an obligation to follow the science???
- What is the role of Clinical Judgment?

**SCIENCE** **EXPERIENCE**

**How to decide?**

132

---

---

---

---

---

---

---

---

## Howard Garb (2013) on Clinical Judgement

- **Clinical judgment is often less valid than statistical or actuarial methods**, especially when clinicians rely on intuition over structured data.
- **Confirmation bias, overconfidence, and selective attention distort clinical decision-making.** Clinicians may unintentionally favor information that supports their initial impressions, leading to diagnostic errors.
- **Structured interviews and standardized assessments methods improve reliability and reduce bias.**
- He encouraged graduate programs to **teach evidence-based assessment, critical thinking, and statistical reasoning** as foundations for clinical competence.

Garb, H. N. (2013). Clinical judgment and decision making. In J. R. Gaham & J. A. Naglieri (Eds.), *APA Handbook of Testing and Assessment in Psychology: Vol. 2. Testing and Assessment in Clinical and Counseling Psychology* (pp. 453-463). Washington, DC: American Psychological Association. <https://doi.org/10.1037/14649-024>

## PASS

- Given that PASS scales **CAN** be interpreted it is important to know
  - do PASS scales yield **PROFILES** that can be used in a Pattern of Strengths and Weaknesses approach to eligibility determination
  - What about all the other tests?

## Research on PASS Profiles

**Students receiving special education were more than four times as likely to have at least one PASS weakness and a comparable academic weakness than those in regular education**

### Identifying Students With Learning Disabilities: Composite Profile Analysis Using the Cognitive Assessment System

Larry V. Naglieri, Andrew N. Butler,<sup>1</sup> and the CAS Consortium

**Abstract**  
The purpose of cognitive profiles in children with learning disabilities (LD) has been explored in the literature recently. Little is known about how cognitive profiles compare to other measures of cognitive ability and how they relate to academic achievement. This study explored the relationship between cognitive profiles and academic achievement in a sample of 1,692 students with LD and 367 students in regular education. The results showed that students with LD had significantly higher scores on the Cognitive Assessment System (CAS) than students in regular education. This finding suggests that the CAS is a valid measure of cognitive ability and that it can be used to identify students with LD.

"Ten core profiles from a regular education sample (N = 1,692) and 12 profiles from a sample of students with LD (N = 367) were found."

Small Psychology Quarterly, 16(1), 11-16, 2001, pp. 11-16

### Can Profile Analysis of Ability Test Scores Work? An Illustration using the PASS Theory and CAS with an Unselected Cohort

Jack A. Naglieri  
George Mason University

A new approach to qualitative analysis of children's profiles as a test of ability was tested. The Planning, Attention, Simultaneous, and Successive (PASS) profiles revealed by the Cognitive Assessment System were used to identify ten profiles for analysis. These profiles were used to examine the PASS profiles for a nationally representative sample of 1,692 children from ages 7 through 17 years. This sample included children in both regular (n = 1,692) and special (n = 367) educational settings. Children with significant PASS weaknesses, called deficits,

DISCRIMINANT VALIDITY OF THE COGNITIVE ASSESSMENT SYSTEM FOR STUDENTS WITH WRITTEN EXPRESSION DISABILITIES

Jack A. Naglieri  
University of Missouri - Kansas  
Andrew S. Galvani  
University of Southern California  
Kathleen A. Smith  
San Francisco State University

The study explored the discriminant validity of the Cognitive Assessment System (CAS) for students with written expression disabilities (WED). The CAS is a measure of cognitive ability that is based on the PASS theory of cognitive ability. The study found that the CAS was able to discriminate between students with WED and students without WED. This finding suggests that the CAS is a valid measure of cognitive ability and that it can be used to identify students with WED.

"the present study demonstrated the potential of the CAS to correctly identify students who demonstrated behaviors consistent with ADHD diagnosis."

## Consistency of PASS Profiles: English & Spanish

### Bilingual Hispanic Children's Performance on the English and Spanish Versions of the Cognitive Assessment System

Jack A. Naglieri, George Mason University

Elaine Olson, George Mason University

Brittany DeLander, George Mason University

Holly Matis, Virginia Commonwealth University

This study compared the performance of bilingual Hispanic children on the English, Attention, Simultaneous, and Successive (PASS) theory as measured by English and Spanish versions of the Cognitive Assessment System (CAS; Naglieri & Butler, 2007). The results suggest that students scored consistently on both English and Spanish versions of the CAS. Within each version of the CAS, the strongest abilities correlated with scores on the Successive processing subtests of the PASS theory. These findings suggest that the CAS is a valid measure of cognitive ability and that it can be used to identify students with learning disabilities.

1. Very similar scores in English and Spanish versions of CAS  
2. >90% agreement between PASS weaknesses & strengths using English and Spanish CAS

### The Neurocognitive Assessment of Hispanic English-Language Learners With Reading Failure

Taty M. Olson, Department of Clinical Psychology and School Psychology, Chicago School of Professional Psychology, Chicago, Illinois

Laurie Gonzalez, George Mason University, Fairfax, Virginia

Jack A. Naglieri, University of Virginia, Fairfax, Virginia

This study examined the performance of bilingual Hispanic English-language learners (ELLs) on the English and Spanish versions of the Cognitive Assessment System (CAS; Naglieri & Butler, 2007). The CAS measures four neurocognitive processes based on the PASS theory: Attention, Simultaneous, and Successive (PASS) theory (Naglieri & Butler, 2007). The results suggest that students scored consistently on both English and Spanish versions of the CAS. Within each version of the CAS, the strongest abilities correlated with scores on the Successive processing subtests of the PASS theory. These findings suggest that the CAS is a valid measure of cognitive ability and that it can be used to identify students with learning disabilities.
