IDEA and NASP Guidelines

What are some of the details of the Law?

One Hundred Eighth Congress
 of the
 United States of America

AT THE SECOND SESSION
 Begun and held at the City of Washington
 the twentieth day of January, two thousand and four

An Act
 To reauthorize the Individuals with Disabilities Education Act of 2004.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,

SECTION 1. SHORT TITLE.
 This Act may be cited as the “Individuals with Disabilities Education Improvement Act of 2004”.

SEC. 2. ORGANIZATION OF THE ACT.

Individuals with Disabilities Education Improvement Act of 2004

IDEA 2004

IQ achievement discrepancy no longer required

“(6) SPECIFIC LEARNING DISABILITIES.—
 “(A) IN GENERAL.—Notwithstanding section 607(b), when determining whether a child has a specific learning disability as defined in section 602, a local educational agency shall not be required to take into consideration whether a child has a severe discrepancy between achievement and intellectual ability in oral expression, listening comprehension, written expression, basic reading skill, reading comprehension, mathematical calculation, or mathematical reasoning.
 “(B) ADDITIONAL AUTHORITY.—In determining whether a child has a specific learning disability, a local educational agency may use a process that determines if the child responds to scientific, research-based intervention as a part of the evaluation procedures described in paragraphs (2) and (3).”

IQ Achievement Discrepancy Model

Ability Achievement model is still permitted in IDEA
 But it doesn't reveal the reason for the academic failure

Full Scale IQ
 Academic Skills Weakness(es)

Significant Discrepancy

IDEA 2004

“use a variety of assessment tools”

“(2) CONDUCT OF EVALUATION.—In conducting the evaluation, the local educational agency shall—
 “(A) use a variety of assessment tools and strategies to gather relevant functional, developmental, and academic information, including information provided by the parent, that may assist in determining—
 “(i) whether the child is a child with a disability; and
 “(ii) the child's needs for positive behavioral supports, and other supports that may be necessary to assist the child in attending, learning, participating in general education, and achieving positive outcomes; and
 “(B) not use any single measure or assessment as the sole criterion for determining whether a child is a child with a disability or determining an appropriate educational program for the child; and
 “(C) use technically sound instruments that may assess the relative contribution of cognitive and behavioral factors, in addition to physical developmental factors.”

“not use any single measure as sole criterion”

“assess cognitive factors”

IDEA 2004

“(3) ADDITIONAL REQUIREMENTS.—Each local educational agency shall ensure that—
 “(A) assessments and other evaluation materials used to assess a child under this section—
 “(i) are selected and administered so as not to be discriminatory on a racial or cultural basis;
 “(ii) are provided and administered in the language and form most likely to yield accurate information on what the child knows and can do academically, developmentally, and functionally, unless it is not feasible to so provide or administer;
 “(iii) are used for purposes for which the assessments or measures are valid and reliable;
 “(iv) are administered by trained and knowledgeable personnel; and
 “(v) are administered in accordance with any instructions provided by the producer of such assessments;
 “(B) the child is assessed in all areas of suspected disability; and
 “(C) assessment tools and strategies that provide relevant information that directly assists persons in determining whether a child has a disability are used to the maximum extent appropriate.”

non discriminatory assessments

valid and reliable assessment

IDEA 2004

“(6) SPECIFIC LEARNING DISABILITIES.—
 “(A) IN GENERAL.—Notwithstanding section 607(b), when determining whether a child has a specific learning disability as defined in section 602, a local educational agency shall not be required to take into consideration whether a child has a severe discrepancy between achievement and intellectual ability in oral expression, listening comprehension, written expression, basic reading skill, reading comprehension, mathematical calculation, or mathematical reasoning.
 “(B) ADDITIONAL AUTHORITY.—In determining whether a child has a specific learning disability, a local educational agency may use a process that determines if the child responds to scientific, research-based intervention as a part of the evaluation procedures described in paragraphs (2) and (3).”

RTI may be used AS A PART OF the evaluation... but not as sole method

IDEA 2004

Definition of SLD remains the same

“(30) SPECIFIC LEARNING DISABILITY.—
 “(A) IN GENERAL.—The term ‘specific learning disability’ means a disorder in 1 or more of the basic psychological processes involved in understanding or in using written, spoken, or visually presented material, which disorder may manifest itself in imperfect ability to listen, think, speak, read, reason, or do mathematical calculations.
 “(B) INCLUDED.—Such term includes such conditions as perceptual disabilities, brain injury, minimal brain dysfunction, dyslexia, and developmental aphasia.
 “(C) EXCLUDED.—Such term does not include—
 “(i) conditions that are primarily the result of intellectual disability, or of mental retardation, or of emotional disturbance, or of environmental, cultural, or economic disadvantage.”

These statements describe a pattern of strengths and weaknesses in basic psychological processes; but not low in all processes

IDEA Law Summary

- Ability achievement discrepancy is no longer required (not disallowed)
- We must use a variety of assessment tools
- The use of any single measure or assessment as the sole criterion for determining SLD is *not permitted*
- RTI alone is not permitted
- Use assessments that are not discriminatory on racial or cultural basis
- Definition of SLD remains
 - ‘a disorder in one or more of the basic psychological processes’
- For more information see: <http://idea.ed.gov/>

Position Statement

IDENTIFICATION OF STUDENTS WITH SPECIFIC LEARNING DISABILITIES

NASP endorses the provision of “effective services to help children and youth succeed academically, socially, behaviorally, and emotionally” (Standards for Graduate Preparation of School Psychologists, 2010b, p. 1). NASP’s position is that identification of and service delivery to children identified as having a specific learning disability (SLD) should be based on the existence of sustained, high-quality, research-based instruction. Such instruction best occurs in the least restrictive environment and is accompanied by regular data collection. School psychologists have long had a prominent role as members of school teams that identify students exhibiting SLD. Accordingly, NASP is dedicated to promoting policies and practices that are consistent with scientific research and that yield optimal student outcomes. School psychologists are science-practitioners, and, as consumers of and contributors to research, they generally agree on the following statements (J.D. Kover, 2002; National Joint Committee on Learning Disabilities, 2000; Shinn, 2007; Swanson, Harniss, & Graham, 2003).

- Specific learning disabilities are endogenous in nature and are characterized by neurologically based deficits in cognitive processes.
- These deficits are specific; that is, they impact particular cognitive processes that interfere with the acquisition of academic skills.
- Specific learning disabilities are heterogeneous—there are various types of learning disabilities, and there is no single defining academic or cognitive deficit or characteristic common to all types of specific learning disabilities.
- Specific learning disabilities may coexist with other disabling conditions (e.g., sensory deficits, language impairment, behavior problems), but are not primarily due to these conditions.
- Of children identified as having specific learning disabilities, the great majority (over 80%) have a disability in the area of reading.
- The manifestations of a specific learning disability is contingent to some extent upon the type of instruction, supports, and accommodations provided, and the demands of the learning situation.
- Early intervention can reduce the impact of many specific learning disabilities.
- Specific learning disabilities vary in their degree of severity, and evidence to secure learning disabilities can be expected to impact performance throughout the life span.
- Multitiered systems of student support have been effective as part of comprehensive approach to

www.nasponline.org

NASP 2011 SLD Position

- “NASP recommends that initial evaluation of a student with a suspected specific learning disability includes an individual comprehensive assessment...”
- This evaluation may include measures of **academic skills** (norm-referenced and criterion-referenced), **cognitive abilities** and **processes**, and **mental health status** (social-emotional development); measures of academic and **oral language** proficiency as appropriate; **classroom observations**; and indirect sources of data (e.g., teacher and parent reports).”

NASP 2011 SLD Position

- “Existing data from a problem-solving process that determines if the child responds to scientific evidence-based intervention may be considered at the time of referral, or new data of this type may be collected as part of the Tier 3 comprehensive evaluation.
- Eligibility determination should not be based on any single method, measure, or assessment.”

Kenneth A. Kavale
College of Education, University of Iowa

Abstract

The recently revised IDEA guidelines indicate that a Specific Learning Disability (SLD) can be identified if a child has a disorder in the basic psychological processes. The criteria in the new guidelines for identifying SLD state that: a) a severe discrepancy between achievement and intellectual ability must be required; and b) a response to intervention (RTI) may be considered. These criteria are analogous regarding how the traditional ability-achievement discrepancy approach should be applied, and they are equally ambiguous about the recently adopted failure to RTI model. Absent from these criteria is any mention of integration. Identifying a child’s unique pattern of performance on standardized measures not only assesses compliance with the new IDEA guidelines, but also allows for recognition of individual cognitive strengths and needs, one of the prerequisites for intervention efficacy.

Specific Learning Disability Classification in the New Individuals with Disabilities Education Act: The Danger of Good Ideas

The National Assessment of Educational Progress (NAEP) recently released the nationwide results of reading and math scores for children in fourth and eighth grades. Despite scores all students, no gains were made in reading scores from

Hale, Naglieri, Kaufman, & Kavale (2004)

- Because the definition of SLD is
 - “... a **disorder in 1 or more of the basic psychological processes** involved in understanding or in using language, spoken or written, which disorder may manifest itself in the imperfect ability to listen, think, speak, read, write, spell, or do mathematical calculations.”
 - “Establishing a disorder in the basic psychology processes is *essential* for determining SLD”
 - So that the legal definition is aligned with the procedural methods used for eligibility
 - But how, exactly, would measuring basic psychological processes be used for SLD eligibility determination?

The key question is:

How can we operationalize the identification of a “disorder in one or more of the basic psychological processes” which manifests as “the imperfect ability to listen, think, speak, read, write, spell, or do mathematical calculations”?

jnaglieri@gmail.com www.jacknaglieri.com

jnaglieri@gmail.com www.jacknaglieri.com 20

Discrepancy / Consistency Model

- The Discrepancy / Consistency model is a conceptual framework that was first introduced in 1999
- Similar models have been proposed by Hale and Flanagan

1999

2011

21

Discrepancy/Consistency Model (DCM)

- Naglieri (2011). The discrepancy/consistency approach to SLD identification using the PASS theory. In D. P. Flanagan & V. C. Alfonso (Eds.), *Essentials of Specific Learning Disability Identification* (145-172). Hoboken, NJ: Wiley.
- This chapter can be downloaded from www.jacknaglieri.com

THE DISCREPANCY/CONSISTENCY APPROACH TO SLD IDENTIFICATION USING THE PASS THEORY

Jack A. Naglieri

There are many reasons why children experience academic failure (e.g., poor instruction, lack of motivation, visual or auditory problems, lack of exposure to books and reading, instruction that does not meet a child's particular style of learning, overall limited intellectual ability, a specific intellectual ability deficit, etc.). This chapter focuses on those children who have a disorder in one or more of the basic psychological processes that underlie academic success and failure; that is, children with scores on a reliable and well-validated multi-dimensional test of cognitive processes that vary from the average to the well below average range, with corresponding variability in standardized achievement test scores. These children can only be identified via a comprehensive assessment using nationally normed tests that uncover the processing deficit(s) and associated academic failure, despite adequate instruction and a consideration of other exclusionary factors. These types of children would meet the criteria for a specific learning disability (SLD) as defined by the 2004 reauthorization of the Individuals with Disabilities Education Improvement Act (IDEA); see Hale, Kaufman, Naglieri, & Kavale, 2006).

This chapter is about children who have a disorder in one or more of the basic psychological processes. These children's academic failure may be exacerbated by poor instruction, but inadequate teaching did not cause the problem. These children would likely benefit from frequent progress monitoring, but ongoing progress monitoring is not enough to ensure academic success. In order to understand the reasons for academic failure, these children need to be carefully

22

Discrepancy / Consistency Model

- The Discrepancy / Consistency Model is a method used to ensure that there is evidence of “a disorder in 1 or more of the basic psychological processes ... which manifests itself in the imperfect ability to listen, think, speak, read, write, spell, or do mathematical calculations.”
- The disorder in 1 or more basic psychological processes is found when a student shows a pattern of strengths and weaknesses in basic psychological processes, and...
- The imperfect ability to listen, think, speak, read, write, spell, or do mathematical calculations is found when a student shows a pattern of strengths and weaknesses in achievement
- The result is two discrepancies and a consistency

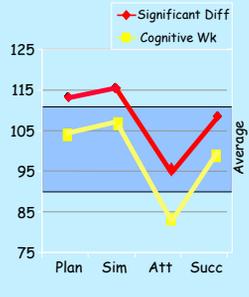

23

Discrepancy Consistency Model for SLD

- **Discrepancy #1** between high and low processing scores
- **Discrepancy #2** between high processing and low achievement
- **Consistency** between low processing and low achievement

24

Evidence of a 'disorder in processing'

- ▶ **Significant Difference**
 - Is low relative to the child's mean score
- ▶ **Cognitive Weakness**
 - Is a Significant weakness and the score falls below the Average range (<90)

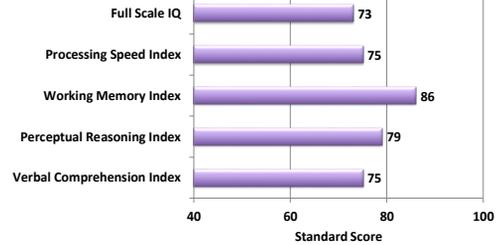

Case of Alejandro

CASE STUDY: ALEJANDRO (C.A. 7-0 GRADE 1)

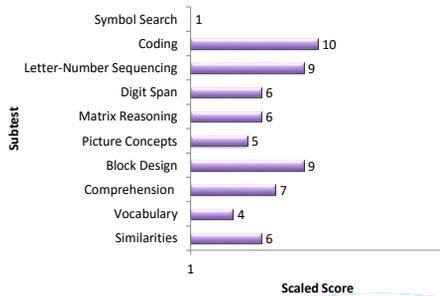

REASON FOR REFERRAL

- **Academic:**
 - Could not identify letters/sounds
 - October 2013: Could only count to 39
 - All ACCESS scores of 1
- **Behavior:**
 - Difficulty following directions
 - Attention concerns
 - Refusal/defiance

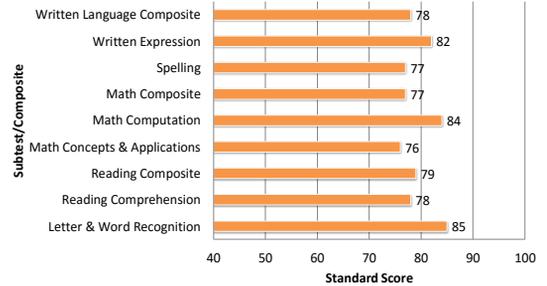

WISC-IV ASSESSMENT

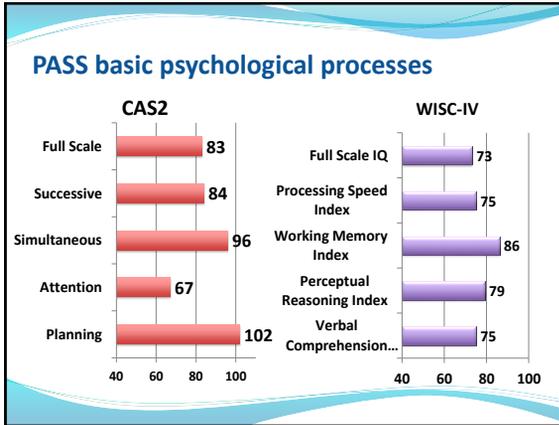

WISC-IV SUBTESTS

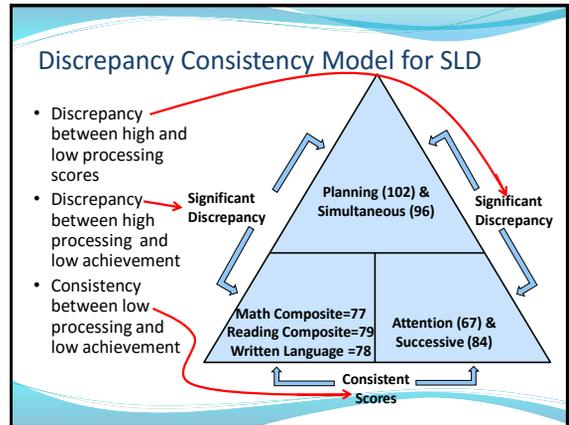

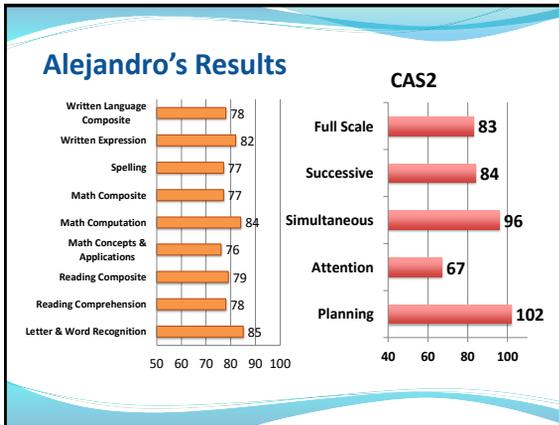

KTEA-II

Thoughts about Alejandro

- We want to help our students, but how?
- What have tried to get information from the Wechsler Scales
 - Subtest analysis (doesn't work)
 - Interpretation of subtests according to other views (Working Memory, Speed, CHC, etc.) -doesn't work
- Cross Battery approach?
 - Reliability and Validity evidence is weak
- Which test/method should we use?
- All these questions will be answered...

The case of Alejandro (by Dr. Otero)

- ▶ Alejandro has a "disorder in one or more of the basic psychological processes"
 - Attention = 67 and Successive = 84
- Good scores in basic psychological processes:
 - Simultaneous = 96 and Planning = 102
- ▶ He has documented academic failure
- ▶ Conclusions: He has intra-individual differences in basic psychological processes that underlie his academic problems

Discrepancy / Consistency Model

- The Discrepancy / Consistency Model is a conceptual approach to ensure that there is evidence of...
 - a *discrepancy* between high and low (e.g., a significant weakness) scores in basic psychological processes
 - a *discrepancy* between high scores in basic psychological processes and low academic scores
 - a *consistency* between low scores in basic psychological processes and low academic scores
- The discrepancies ensure that the student has (1) within student variability in psychological processes and (2) a difference between processing and achievement
- The consistency helps us understand WHY the student has failed and WHAT to do about it

How to Operationalize this Model

- IDEA – “each local educational agency shall ensure that assessments ...used to assess a child” are:
 - “selected ... so as not to be discriminatory on a racial or cultural basis”
 - “used for purposes for which the ... measures are valid and reliable”
 - “technically sound [to assess] cognitive factors”
- Standardized norm based tests are the best way to evaluate and calibrate academic skills
 - Tests like the K-TEA, WIAT-III, WJ-IV, FAR, etc.
- Standardized norm based tests are the best way to evaluate and calibrate basic psychological processes

jnaglieri@gmail.com www.jacknaglieri.com 37

Time to Think and Talk

- Reactions?
- Which test results make more sense?
- Was WISC-IV information Helpful?
- Did CAS2 Results change your mind?
- Can you determine if the student has a SLD using DCM?
- Your thoughts...

CAS in Italy

Multigroup Confirmatory Factor Analysis of U.S. and Italian Children's Performance on the PASS Theory of Intelligence as Measured by the Cognitive Assessment System

Jack A. Naglieri
University of Virginia and Devereux Center for Resilient Children

Kevin Williams
Multi-Health Services, Toronto, Ontario, Canada

Stefano Taddei
University of Florence

This study examined Italian and U.S. children's performance on the English and Italian versions, respectively, of the Cognitive Assessment System (CAS; Naglieri & Ciferri, 2009; Naglieri & Das, 1997), a test based on a neurocognitive theory of intelligence entitled PASS (Planning, Attention, Simultaneous, and Successive; Naglieri & Das, 1997; Naglieri & Ortiz, 2011). CAS subtests, PASS scales, and Full Scale scores for Italian (*N* = 809) and U.S. (*N* = 1,174) samples, matched by age and gender, were examined. Multigroup confirmatory factor analysis results supported the configural invariance of the CAS factor structure between Italian and American for the 5- to 7-year-old (root-mean-square error of approximation [RMSEA] = .038, 90% confidence interval [CI] = .033-.043), comparative fit index [CFI] = .96) and 8- to 18-year-old (RMSEA = .036, 90% CI = .032-.043, CFI = .97) age groups. The Full Scale standard scores using the U.S. norm for the Italian (100.9) and U.S. (100.5) samples were nearly identical. The scores between the samples for the PASS scales were very similar, except for the Attention Scale (*d* = 0.26), where the Italian sample's mean score was slightly higher. Negligible mean differences were found for 9 of the 13 subtests scores, 3 showed small *d* ratios (*d* in favor of the Italian sample), and 1 was large (in favor of the U.S. sample), but some differences in subtest variances were found. These findings suggest that the PASS theory, as measured by CAS, yields similar mean scores and showed factorial invariance for these samples of Italian and American children, who differ on cultural and linguistic characteristics.

US and Italian Samples— Mean Scores

Table 5
Means and SDs for Italian Children (*N* = 809) on the CAS Subtests and PASS and Full Scales Using U.S. Norms and Comparisons to U.S. Sample (*N* = 1,174), Matched by Age

Subtests and scales	Italian			U.S.			<i>F</i>	<i>p</i>	<i>d</i> -ratio

Learning and Attention Disorders in Adolescence and Adulthood

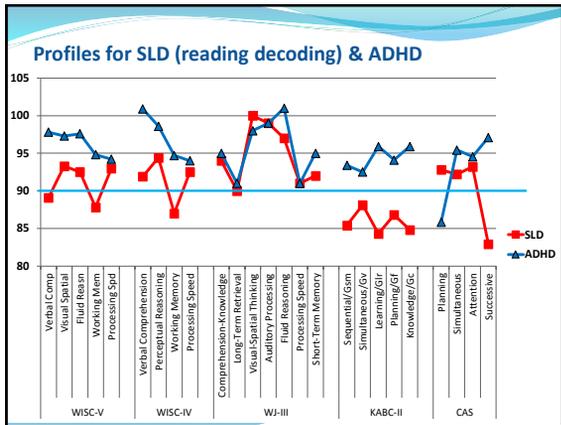

Naglieri & Goldstein (2011)

GROUP PROFILES BY ABILITY TEST

Because ability tests play such an important role in the diagnostic process, it is crucial to understand the sensitivity each test may have to any unique characteristics of those with an SLD or attention deficit. Clinicians need to know if an adolescent or adult has a specific deficit in ability that is related to a specific academic learning problem. There has been considerable research on, for example, Wechsler subtest profile analysis, and most researchers conclude that no profile has diagnostic utility for individuals with SLD or ADHD (Kavale & Forness, 1995). The failure of subtest profiles has led some to argue (e.g., Naglieri, 1999) that scale, rather than subtest, variability should

1. We need to know if argument tests yield distinctive profiles
2. Subtest profile analysis is UNSUPPORTED so use scale profiles instead

PASS Profiles and Educational Placement

School Psychology Quarterly, Vol. 15, No. 4, 2000, pp. 419-431

Students receiving special education were more than four times as likely to have at least one PASS weakness and a comparable academic weakness than those in regular education

Can Profile Analysis of Ability Test Scores Work? An Illustration using the PASS Theory and CAS with an Unselected Cohort

Jack A. Naglieri
George Mason University

A new approach to ipsative, or intraindividual, analysis of children's profiles on a test of ability was studied. The Planning, Attention, Simultaneous, and Successive (PASS) processes measured by the Cognitive Assessment System were used to illustrate how profile analysis could be accomplished. Three methods were used to examine the PASS profiles for a nationally representative sample of 1,597 children from ages 5 through 17 years. This sample included children in both regular (n = 1,453) and special (n = 144) educational settings. Children with significant ipsatized PASS scores, called Relative

Leesa V. Huang¹, Achilles N. Bardos², and Rick Carl D'Amato³

Abstract
The detection of cognitive patterns in children with learning disabilities (LD) has been a priority in the identification process. Subtest profile analysis from traditional cognitive assessment has drawn sharp criticism for inaccurate identification and weak connections to educational planning. Therefore, the purpose of this study is to use a new generation of cognitive tests with ipsatized analysis to augment diagnosis and the instructional process. The Cognitive Assessment System uses a contemporary theoretical model in which composite scores, instead of subtest scores, are used for profile analysis. Ten core profiles from a regular education sample (N = 1,692) and 12 profiles from a sample of students with LD (N = 367) were found. The majority of the LD profiles were unique compared with profiles obtained from the general education sample. The implications of this study substantiate the usefulness of profile analysis on composite scores as a critical element in LD determination.

Discriminative validity of the Cognitive Assessment System for students with written expression disabilities

Judy A. Johnson
University of Houston - Victoria
Achilles N. Bardos
University of Northern Colorado
Kandi A. Tayebi
Sam Houston State University

“this study suggests that the CAS...yields information that contributes to the differential diagnosis of students suspected of having a learning disability in writing”

This study explored the PASS cognitive processing theory in junior high students (aged 11-15 years) with and without written expression disabilities. Ninety-two students with (n = 48) and without (n = 48) written expression disabilities were administered the Das-Naglieri Cognitive Assessment System (DN-CAS; 1997) and the writing subtests of the Wechsler Individual Achievement Test (WIAT; 1997). Discriminant analyses were utilized to identify the DN-CAS subtests and composites that contributed to group differentiation. The Planning composite was found to be the most significant contributor among the four composite scores. Subsequent efficiency of classification analyses provided strong support for the validity of the obtained discriminant functions in that the four DN-CAS composite scale scores correctly identified 83% of the students as members of their respective groups.

Canivez & Gaboury (2010)

“the present study demonstrated the potential of the CAS to correctly identify students who demonstrated behaviors consistent with ADHD diagnosis.”
gcanivez@eiu.edu

Cognitive Assessment System Construct and Diagnostic Utility in Assessing ADHD

George J. Canivez
Evanston Clinical Services

Allen R. Gaboury
Prairie School University, Prairie, IL

Paper presented at the 2010 Annual Convention of the American Psychological Association, San Diego, CA

Canivez, G. J., & Gaboury, A. R. (2010). The Cognitive Assessment System (CAS) as a measure of cognitive ability in children with ADHD. *Journal of Psychoeducational Assessment, 18*(1), 10-19. doi:10.1177/1073426909353057

Abstract: The purpose of this study was to examine the diagnostic utility of the Cognitive Assessment System (CAS) in identifying children with ADHD. The study included 100 children with ADHD and 100 children without ADHD. The CAS was administered to all children, and the results were compared to the results of a standard IQ test. The results showed that the CAS was a valid measure of cognitive ability in children with ADHD, and that it was able to identify children with ADHD who were not identified by the standard IQ test. The implications of this study are discussed.

65

Georgiou & Das (2013)

University Students With Poor Reading Comprehension: The Hidden Cognitive Processing Deficit

George K. Georgiou, PhD¹ & J. P. Das, PhD²

Abstract: The present study aimed to examine the nature of the working memory and general cognitive ability deficits experienced by university students with a specific reading comprehension deficit. A total of 32 university students with poor reading comprehension but average word-reading skills and 60 age-matched controls with no comprehension difficulties participated in the study. The participants were assessed on three verbal working memory tasks that varied in terms of their processing demands and on the Das-Naglieri Cognitive Assessment System, which was used to operationalize intelligence. The results indicated first that the differences between poor and skilled comprehenders on working memory were amplified as the processing demands of the tasks increased. In addition, although poor comprehenders as a group had average intelligence, they experienced significant difficulties in simultaneous and successive processing. Considering that working memory and general cognitive ability are highly correlated processes, these findings suggest that the observed differences between poor and skilled comprehenders are likely a result of a deficient information processing system.

66

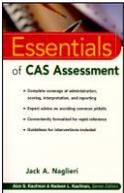

SLD vs ADHD Profiles

- There needs to be evidence that intelligence tests which are widely used in school psychology yield specific profiles at the scale (theoretical) level.
 - Without such evidence their utility to identify a 'disorder in one or more of the basic psychological processes' is limited
 - Subtest profile analysis is not advised
- The next important validity issue is correlation to achievement –
 - Do scores on the cognitive measure relate to academic achievement test scores?

jnaglieri@gmail.com www.jacknaglieri.com 67

IQ Correlations with Achievement?

- IQ scores correlate about .5 to .55 with achievement Intelligence (Brody, 1992)
- But traditional tests have achievement in them
- Naglieri (1999) summarized the correlations between several tests and achievement
 - The median correlation between each test's overall score and all achievement variables was obtained

68

Ability & Achievement (Naglieri, 1999)

	Tests with knowledge		Tests with Little knowledge		
	WISC-III FSIQ	DAS GCA	WJ-R Cog	K-ABC MPC	CAS FS
Median r	.590	.600	.625	.630	.700
N	1,284	2,400	888	2,636	1,600

WISC-3: WIAT Manual Table C.1 ages 6-16; WJ-R Technical Manual; CAS Interpretive Handbook; K-ABC Interpretive Manual; DAS Handbook. Increase = $(r^2 - r_1^2) / r^2$, where r_1^2 = WISC-3 WIAT correlation

Conclusion: YOU DON'T need Verbal and Quantitative to correlate with achievement

69

Correlations with Achievement

- Next, a summary of ability test correlations with achievement EXCLUDING the scales that clearly require knowledge
- The average correlations of the SCALES with achievement and those without achievement were obtained to avoid *critierion contamination...*

70

Correlations with Achievement

- Average correlations between IQ Scales with total achievement scores
- The strength of measuring *basic psychological processes* as PASS is clear

Test Scores	Correlations Between Ability and Achievement	Average Correlation	
		All Scales	Scales without achievement
WISC-V N = 201	Verbal Comprehension Visual Spatial Fluid Reasoning Working Memory Processing Speed	.74 .46 .40 .63 .34	.53 → .47
WJ-IV COG N = 825	Comprehension Knowledge Fluid Reasoning Auditory Processing Short Term Working Memory Cognitive Processing Speed Long-Term Retrieval Visual Processing	.50 .71 .52 .55 .55 .43 .45	.54 → .50
KABC WJ-III ACH N = 167	Sequential/Gsm Simultaneous/Gv Learning/Gf Planning/Gf Knowledge/GC	.43 .41 .50 .39 .76	.53 → .48
CAS WJ-III ACH N=1,600	Planning Simultaneous Attention Successive	.57 .67 .50 .60	.59

Note: WJ-IV Scales Comp-Knows Vocabulary and General Information; Fluid Reasoning = Number Series and Concept Formation; Auditory Processing = Phonological processing.

jnaglieri@gmail.com www.jacknaglieri.com 72

Implications

- Non-discriminatory data suggest that traditional IQ tests yield larger race and ethnic differences than tests of basic psychological processing.
 - Conclusion: KABC2 and CAS2
- Validity data suggests show not all tests yield profiles that differentiate SLD and ADHD, evidence needed for determining strengths and weaknesses suggests.
 - Conclusion: CAS2 yields different profiles
 - And CAS correlates the highest with achievement.

Time to Think and Talk

- Reactions?
- Which results were most surprising?
- Do the results match your experiences in the field?
- Do you still think vocabulary is a good way to measure IQ?
- Your thoughts...

Presentation Outline

- From achievement ability discrepancy to a pattern of strengths and weaknesses
- The Discrepancy/Consistency model
- Which tests to use to define a “basic psychological process”
 - ▶ A neurocognitive theory will be suggested
 - complex decision making (frontal lobes – Planning)
 - focus and resistance to distractions (brain stem - Attention)
 - visual/verbal spatial ability (Occipital/Parietal - Simultaneous)
 - visual/verbal sequencing (Temporal area - Successive)
- Illustrative Case studies
 - How Discrepancy/Consistency yields more accurate eligibility determination
 - How Discrepancy/Consistency leads to intervention planning.

jnaglieri@gmail.com www.jacknaglieri.com 74

Defining basic psychological process

- ▶ How did we identify ‘basic psychological processes’?
 - We should use knowledge from cognitive and neuropsychology to construct a model to test
 - A well tested model can evolve into a THEORY of ‘basic psychological processes’
 - We should not assign new labels to traditional IQ subtests
 - We should recognize the limitations of developing a theory from factor analysis – *“a research program dominated by factor analyses of test intercorrelations is incapable of producing an explanatory theory of human intelligence”* (Lohman & Ippel, 1993, p. 41)

75

Defining basic psychological process

- The term ‘basic psychological processes’ is a modern term for ability (or intelligence) when traditional verbal tests that are confounded by knowledge (e.g., Information, Similarities, Arithmetic, Vocabulary) are excluded
- ‘basic psychological processes’ provide us the means to function and acquire knowledge and skills
 - ▶ Skills, like reading decoding, phonological coding, or math calculation, are *not* examples of a cognitive process
 - ▶ Skill = knowledge that is well learned and therefore can be performed with little thinking

76

Cognition or Knowledge?

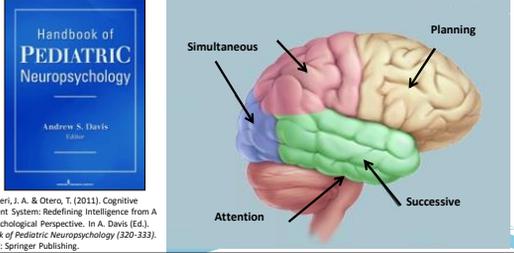

- What does the student have to **know** to complete a task?
 - This is dependent on *instruction*
- How does the student have to **think** to complete a task?
 - This is dependent on the *brain* – ‘**basic psychological processes**’
- We must assess ability and achievement separately

Basic Psychological Processes

Connecting IDEA with practice

Brain, Cognition, & Intelligence

- The brain is the seat of abilities called PASS
- These basic psychological processes are the foundation of learning (Naglieri & Otero, 2011)

See Naglieri, J. A. & Otero, T. (2011). Cognitive Assessment System: Redefining Intelligence from a Neuropsychological Perspective. In A. Davis (Ed.), *Handbook of Pediatric Neuropsychology* (320-333). New York: Springer Publishing.

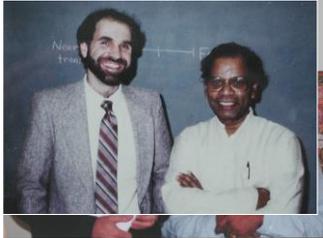

PASS & Basic Psychological Processes

- **P**lanning = THINKING ABOUT HOW YOU DO WHAT YOU DECIDE TO DO
- **A**ttention = BEING ALERT AND RESIST DISTRACTIONS
- **S**imultaneous = GETTING THE BIG PICTURE
- **S**uccessive = FOLLOWING A SEQUENCE
- **PASS theory** is a modern way to measure neurocognitive abilities related to brain function

What is a Basic Psychological Process?

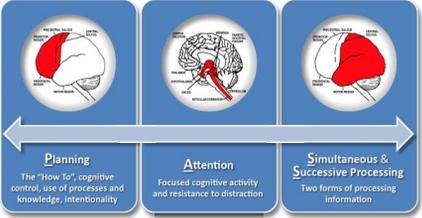

- A specific cognitive process provides a unique kind of function
- A variety of cognitive processes is needed to meet the many demands of our complex environment
- A variety of cognitive processes gives us away of achieving the same goal using different types of or different combinations of processes (this is important for intervention planning).

A Neurocognitive approach to understanding learning and learning problems

PASS: A neurocognitive approach

Three Functional Units described by A. R. Luria

Planning
The "How To", cognitive control, use of processes and knowledge, intentionality

Attention
Focused cognitive activity and resistance to distraction

Simultaneous & Successive Processing
Two forms of processing information

The Working Brain: An Introduction to Neuropsychology
A.R. Luria

PASS Theory

- ▶ **Planning** is a basic psychological process we use to determine, select, and apply efficient solutions to problems
 - problem solving
 - developing plans and using strategies
 - impulse control and self-control
 - control of processing
 - retrieval of knowledge

CAS2: Rating Scale Planning

Directions for Items 1–10. These questions ask how well the child or adolescent decides how to do things to achieve a goal. They also ask how well a child or adolescent thinks before acting and avoids impulsivity. Please rate how well the child or adolescent creates plans and strategies to solve problems.

During the past month, how often did the child or adolescent ...

	Never	Rarely	Sometimes	Frequently	Always
1. produce a well-written sentence or a story?	0	1	2	3	4
2. evaluate his or her own actions?	0	1	2	3	4
3. produce several ways to solve a problem?	0	1	2	3	4
4. have many ideas about how to do things?	0	1	2	3	4
5. have a good idea about how to complete a task?	0	1	2	3	4
6. solve a problem with a new solution when the old one did not work?	0	1	2	3	4
7. use information from many sources when doing work?	0	1	2	3	4
8. effectively solve new problems?	0	1	2	3	4
9. have well-described goals?	0	1	2	3	4
10. consider new ways to finish a task?	0	1	2	3	4

87

Math Strategies

Note to the Teacher: When we teach children skills by helping them use strategies and plans for learning, we are teaching both knowledge and processing. Both are important.

88

PASS Theory: Planning

Planning

- Evaluate a task
- Select or develop a strategy to approach a task
- Monitor progress during the task
- Develop new strategies when necessary

Examples of classroom problems related to Planning

- using the same strategy even if it is not effective
- struggling with how to complete tasks
- Not monitoring progress during a task
- Misinterpretation of what is read

Naglieri, J. and Pickering, E., Helping Children Learn, 2003

89

PASS Theory

- Attention** is a basic psychological process we use to selectively attend to some stimuli and ignores others
 - focused cognitive activity
 - selective attention
 - resistance to distraction

RED
BLUE

90

CAS2: Rating Scale Attention

Directions for Items 21–30. These questions ask how well the child or adolescent pays attention and resists distractions. The questions also ask about how well someone attends to one thing at a time. Please rate how well the child or adolescent pays attention.

During the past month, how often did the child or adolescent ...

	Never	Rarely	Sometimes	Frequently	Always
21. work well in a noisy area?	0	1	2	3	4
22. stay with one task long enough to complete it?	0	1	2	3	4
23. not allow the actions or conversations of others to interrupt his or her work?	0	1	2	3	4
24. stay on task easily?	0	1	2	3	4
25. concentrate on a task until it was done?	0	1	2	3	4
26. listen carefully?	0	1	2	3	4
27. work without getting distracted?	0	1	2	3	4
28. have a good attention span?	0	1	2	3	4
29. listen to instructions or directions without getting off task?	0	1	2	3	4
30. pay attention in class?	0	1	2	3	4

false detections

93

Attention

This sheet has a strong Attention demands because of the similarity of the options

11. A 3:15 A.M. B 3:30 P.M. C 3:15 P.M. D 3:15 A.M.

12. Trent began studying at 5:00 P.M. and finished 1 hour and 22 minutes later. What time did he finish?

13. Maura began basketball practice at 3:00 P.M. and finished 50 minutes later. What time did she finish?

14. Lance fished from 6:00 A.M. to 9:45 A.M. How long did he fish?

Use the calendar for 11/17

94

PASS Theory: Attention

- Attention
 - Focus on one thing and ignore others
 - Resist distractions in the learning environment

Examples of classroom problems related to Attention

- Trouble focusing on what is important
- Difficulty resisting distractions
- Difficulty working on the same task for very long
- unable to see all the details
- Providing incomplete or partially wrong answers

Naglieri, J. and Pickering, E., Helping Children Learn, 2003

95

PASS Theory

- Simultaneous is a basic psychological process which we use to integrate stimuli into groups
 - Stimuli are seen as a whole
 - Each piece must be related to the others
 - Content is not relevant

96

CAS2: Rating Scale Simultaneous

Directions for Items 11–20. These questions ask how well the child or adolescent sees how things go together. They also ask about working with diagrams and understanding how ideas fit together. The questions involve seeing the whole without getting lost in the parts. Please rate how well the child or adolescent visualizes things as a whole.

During the past month, how often did the child or adolescent ...

	Never	Rarely	Sometimes	Frequently	Always
11. like to draw designs?	0	1	2	3	4
12. figure out how parts of a design go together?	0	1	2	3	4
13. classify things into groups correctly?	0	1	2	3	4
14. work well with patterns and designs?	0	1	2	3	4
15. see how objects and ideas are alike?	0	1	2	3	4
16. work well with physical objects?	0	1	2	3	4
17. like to use visual materials?	0	1	2	3	4
18. see the links among several things?	0	1	2	3	4
19. show interest in complex shapes and patterns?	0	1	2	3	4
20. recognize faces easily?	0	1	2	3	4

CAS2 Verbal-Spatial Relations

1 2 3 4 5 6

Which picture shows a boy behind a girl?

PASS Theory: Simultaneous

Simultaneous Processing

- Relate separate pieces of information into a group
- See how parts related to whole
- Recognize patterns

Examples of classroom problems related to Simultaneous Processing

- Difficulty comprehending text
- Difficulty with math word problems
- Trouble recognizing sight words quickly
- Trouble with spatial tasks
- Often miss the overall idea

Numbers from 1 to 100

Name: _____ Secret number: _____

Write the numbers 1 to 100 in order.

100% beautiful handwriting

1	2	3	4	5	6	7	8	9	10
11	12	13	14	15	16	17	18	19	20

31	32	33	34	35	36	37	38	39	40
41	42	43	44	45	46	47	48	49	50
51	52	53	54	55	56	57	58	59	60
61	62	63	64	65	66	67	68	69	70
71	72	73	74	75	76	77	78	79	80
81	82	83	84	85	86	87	88	89	90
91	92	93	94	95	96	97	98	99	100

Simultaneous processing is used in this work sheet because it helps the child see the patterns in the math

Modern Theory: Successive

▶ **Successive** processing is a basic psychological process we use to manage stimuli in a specific serial order

- Stimuli form a chain-like progression
- Stimuli are not inter-related

The child answers a question about a statement read by the examiner such as:

The red greened the blue with a yellow.

Who got greened?

102

CAS2: Rating Scale Successive

Directions for Items 31–40. These questions ask how well the child or adolescent remembers things in order. The questions ask about working with numbers, words, or ideas in a series. The questions also ask about doing things in a certain order. Please rate how well the child or adolescent works with things in a specific order.

During the past month, how often did the child or adolescent ...

	Never	Rarely	Sometimes	Frequently	Always
31. recall a phone number after hearing it?	0	1	2	3	4
32. remember a list of words?	0	1	2	3	4
33. sound out hard words?	0	1	2	3	4
34. correctly repeat long, new words?	0	1	2	3	4
35. remember how to spell long words after seeing them once?	0	1	2	3	4
36. imitate a long sequence of sounds?	0	1	2	3	4
37. recall a summary of ideas word for word?	0	1	2	3	4
38. repeat long words easily?	0	1	2	3	4
39. repeat sentences easily, even if unsure of their meaning?	0	1	2	3	4
40. follow three to four directions given in order?	0	1	2	3	4

Successive Raw Score

Jack A. Naglieri, Ph.D. jnaglieri@gmu.edu 103

Word Series, Sentence Repetition (Ages 5-7) or Sentence Questions (Ages 8-17)

- Word Series
 - Child repeats high imagery single syllable words presented at 1 per second
- Sentence Repetition
 - Child repeats sentences exactly as stated by the examiner such as:
 - The red greened the blue with a yellow.
- Sentence Questions
 - Child answers a question about a statement made by the examiner such as:
 - The red greened the blue with a yellow. Who got greened?

jnaglieri@gmail.com www.jacknaglieri.com 112

The Case of Rocky – Discrepancy Consistency Model example

From assessment to intervention

Jack A. Naglieri, Ph.D. jnaglieri@gmu.edu

The case of Rocky

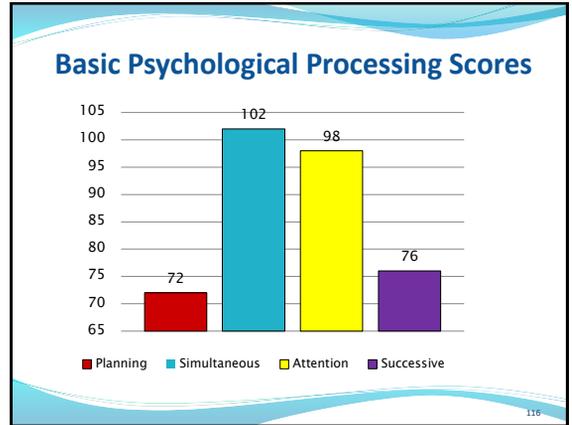

- Rocky¹ is a real child with a real problem
- He lives in a large middle class school district
 - a wide variety of services are available
- In first grade Rocky was performing significantly below grade benchmarks in reading, math, and writing.
 - He received group reading instruction weekly and six months of individual reading instruction from a reading specialist
 - He made little progress and was retained

Note: This child's name and other potentially revealing data have been changed to protect his identity.

114

The case of Rocky

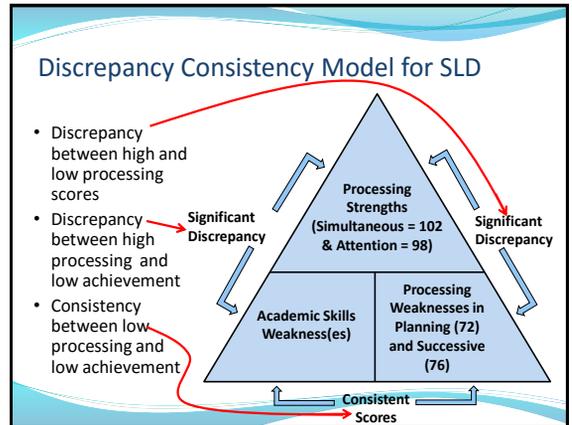

- By the middle of his second year in first grade Rocky was having difficulty with
 - decoding, phonics, and sight word vocabulary; math problems, addition, fact families, and problem solving activities;
 - and focusing and paying attention."
- After two years of special team meetings and special reading instruction he is now working two grade levels below his peers and is having difficulty in reading, writing, and math
- A comprehensive evaluation was conducted
- Here is a look at just the evidence of a 'disorder in basic psychological processes'

The case of Rocky

- He has intra-individual differences in cognitive processes that underlie his academic problems
- Rocky has a "disorder in one or more of the basic psychological processes"

	Score	Diff	Significant	S/W
Planning	72	-15.0	yes	Weakness
Simultaneous	102	15.0	yes	
Attention	98	11.0	yes	
Successive	76	-11.0	yes	Weakness
PASS mean	87.0			

The case of Rocky

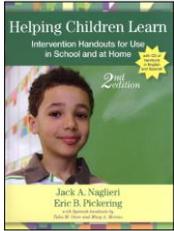

- Rocky meets the definition of SLD in IDEA
 - He requires specialized intervention that takes into account his learning needs
 - Intervention should emphasize the use of strategies and plans in all content areas
 - Intervention should include ways to better work with serial information
 - Rote memory and phonics instruction are ill-advised

Intervention Resources

- Intervention resources

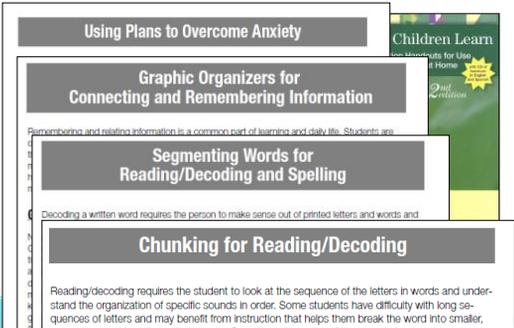

Interventions

- Helping Children Learn Intervention Handouts for Use in School and at Home, *Second Edition*

Basic Psychological Processes and Intervention

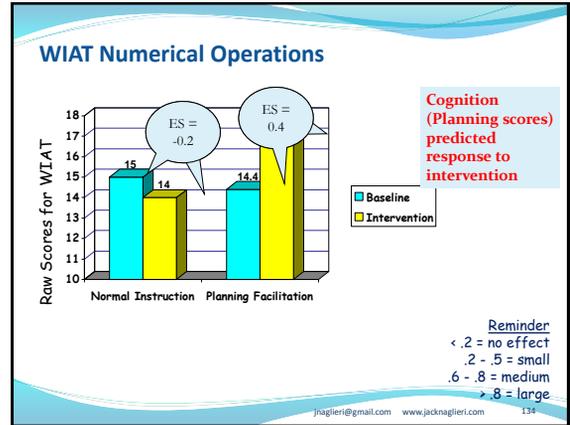

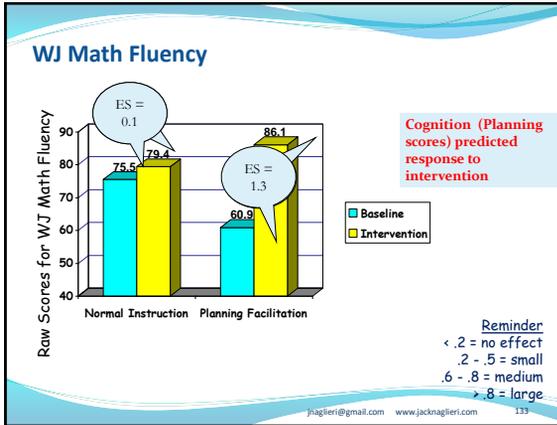

The first time a test of ability has been shown to be relevant to instruction/intervention

A Cognitive Strategy Instruction to Improve Math Calculation for Children With ADHD and LD: A Randomized Controlled Study

Jackie S. Iseman¹ and Jack A. Naglieri¹

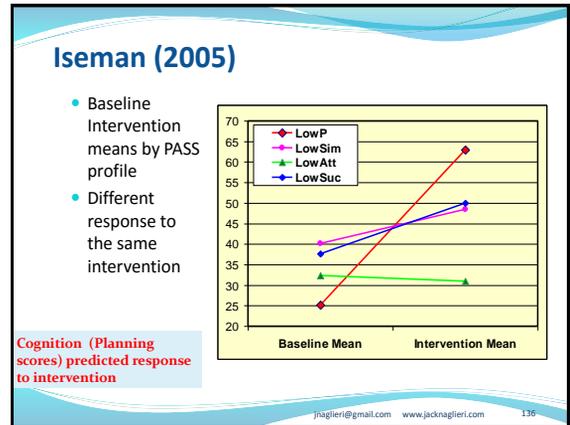

Abstract
The authors examined the effectiveness of cognitive strategy instruction (Successive) given by special education teachers to students with ADHD. The experimental group were exposed to a brief cognitive strategy instruction, development and application of effective planning for mathematical computation, compared to a control group that received standard math instruction. Standardized tests of cognitive processes as well as math worksheets were administered. The experimental group completed math worksheets throughout the experimental period. The Johnson Tests of Achievement, Third Edition, Math Fluency and Wechsler Numerical Operations were administered pre- and postintervention, and a follow-up. Large pre-post effect sizes were found for students in the experimental group (0.85 and 0.26), Math Fluency (1.17 and 0.09), and NCTM. At 1 year follow-up, the experimental group continued to outperform the control group. Students with ADHD evidenced greater improvement in math worksheets (which measured the skill of generalizing learned strategies to other situations) when provided the PASS-based cognitive strategy instruction.

One Year Follow-up

At 1-year follow-up, 27 of the students were retested on the WJ-III ACH Math Fluency subtest as part of the school's typical yearly evaluation of students. This group included 14 students from the comparison group and 13 students from the experimental group. The results indicated that the improvement of students in the experimental group ($M = 16.08$, $SD = 19$, $d = 0.85$) was significantly greater than the improvement of students in the comparison group ($M = 3.21$, $SD = 18.21$, $d = 0.09$).

PASS Comprehensive System

GOAL: Create a set of tools to measure PASS Theory for use across multiple settings and multiple tiers

PASS Comprehensive System

CAS2 (12 subtests)

Examiner's Manual

CAS2: Brief (4 subtests)

Examiner's Manual

CAS2: Rating Scale

Examiner's Manual

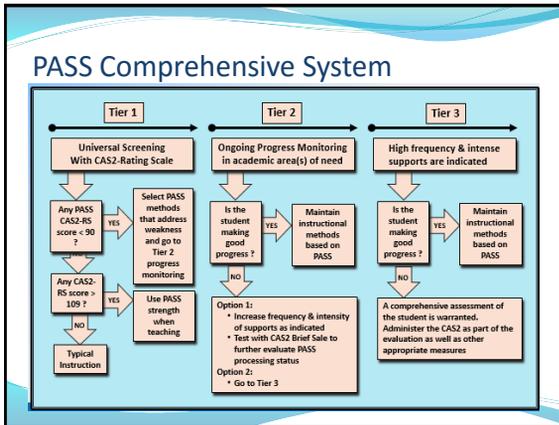

PASS Comprehensive System

(Naglieri, Das, & Goldstein, 2014)

CAS2 Rating Scale (4 subtests)	CAS2 Brief (4 subtests)	CAS2 Core (8 subtests)	CAS2 Extended (12 subtests)
Total Score Planning Simultaneous Attention Successful	Total Score Planning Simultaneous Attention Successful	Full Scale Planning Simultaneous Attention Successful	Full Scale Planning Simultaneous Attention Successful Supplemental Scales Executive Function Working Memory Verbal / Nonverbal Visual / Auditory

PASS Comprehensive System

- At Tier 1 CAS2: Rating Scale can be completed by a teacher and depending upon those results...
- At Tier 2 the CAS2: Brief scale could be given to inform instruction and for screening
- At Tier 3 the CAS2: Extended Battery could be given for full evaluation of his neurocognitive abilities
- This PASS Comprehensive System provides three ways to learn about a student's learning strengths and weaknesses

CAS2 (Ages 5-18 yrs.)

Materials shown include: CAS2 Rating Scale, CAS2 Brief, CAS2 Core, CAS2 Extended, Administration and Scoring Manual, Interpretive Manual, Stimulus Book Part 1, Stimulus Book Part 2, and Stimulus Book Part 3.

CAS2 Development Goals

- CAS2**
 - New norms
 - Strengthen reliability of the scales by modifying subtest formats
 - Improve factor structure
 - Add/delete items
 - Add a visual Successful subtest
 - Add new scales beyond PASS
 - Retain Administration format of
 - Examiner demonstrates,
 - Child does a sample
 - Directions for remaining items is given
 - And opportunity to Provide Help is given

Provide Help

Item Set 1

Expose Item Set 1 and say,

Look at this page. There are many boxes for you to fill in (point to the portion of the page with the empty boxes, but do not point in a sweeping motion to the rows or columns). Fill in as many of these as you can, as fast as you can, using these answers (point to the coded boxes, and pause for 3-5 seconds to allow the examinee to look at the page). You can do it any way you want. Let's see how many you can do.

Ready? (Provide a brief explanation if necessary)

Begin. Start timing. Allow 60 seconds (1:00 minute). Record the time to completion and strategy use.

If the examinee stops or spends more than 1 or 2 seconds erasing, immediately say, **Keep going.**

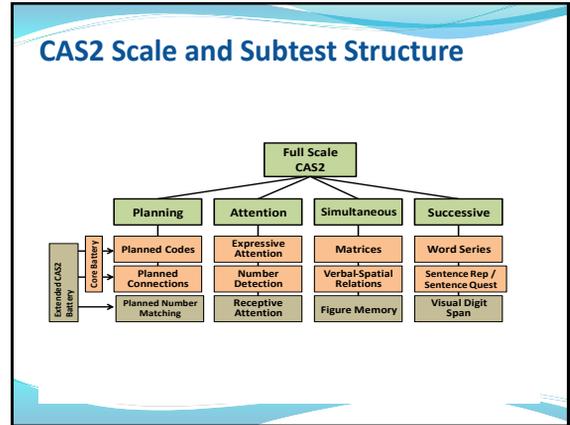

If the examinee is still working after the time limit expires, say, **Stop.** Record the time in seconds. Note strategy use.

The examiner can explain the demands of the task in any manner deemed appropriate and in any language

CAS2

- Same 8 (40 minutes) or 12 (60 minutes) subtest versions
- PASS and Full Scales provided (100 & 15) subtests (10 and 3)

Figure 2.1. Completed pages of the Examiner Record Form for William.

CAS2

- All subtests modified
- Planning subtests have more items
- Speech Rate deleted
- New: Visual Digit Span subtest

Subtest	Raw Score	Scaled Score			
		PLAN	SIM	ATT	SUC
Planned Codes (PC)	94	7			
Planned Connections (PCN)	105	8			
Planned Number Matching (PNM)	10				
Matrices (MAT)	20		10		
Verbal-Spatial Relations (VSR)	15		11		
Figure Memory (FM)	16		10		
Expressive Attention (EA)	45			9	
Number Detection (ND)	74			10	
Receptive Attention (RA)	49			9	
Word Series (WS)	11				7
Sentence Repetition/Questions (SRQ)	8				7
Visual Digit Span (VDS)	10				6
Sum of Subtest Scaled Scores		28	31	28	20
PASS Composite Index Scores		84	102	91	78
Percentile Rank		14	55	31	18
% Confidence Interval		12	105	104	87
		78	91	89	74

CAS2

- Supplementary Scales: Executive Function, Working Memory, Verbal, Nonverbal
- Added: A Visual and Auditory comparison

Subtest	Scaled Score				
	EF w/o WM	EF w/ WM	WM	VC	NVC
Planned Codes					7
Planned Connections	8	8			
Matrices					10
Verbal-Spatial Relations		11	11	11	
Figure Memory					10
Expressive Attention	9	9			
Receptive Attention					9
Sentence Repetition/Questions		7	7	7	
Sum of Subtest Scaled Scores	17	35	18	27	27
Composite Index Scores	91	91	94	99	92
Percentile Rank	27	27	34	32	30
% Confidence Interval	Upper	101	99	101	101
	Lower	84	85	88	87

Note: EF w/o WM = Executive Function without Working Memory; EF w/ WM = Executive Function with Working Memory; WM = Working Memory; VC = Verbal Content; NVC = Nonverbal Content.

CAS2 Planning & Simultaneous

- Planned Number Matching
 - Variation on the original version
- Planned Codes
 - Variation on the original version
- Planned Connections
 - Additional items
- Matrices
 - More items added
- Verbal-Spatial Relations
 - More items added
- Figure Memory
 - More items added

CAS2 Attention & Successive

- Expressive Attention
 - No in color
- Number Detection
 - New format
- Receptive Attention
 - New format
- Word Series
 - Sentence Repetition
 - Ages 5-7
 - Sentence Questions
 - Ages 8-18
 - Visual Digit Span
 - New subtest

CAS2 Online Scoring and Report Writing

CAS2 Online Score & Report

<http://www.proedinc.com/customer/ProductView.aspx?ID=7277>

- ▶ Enter data at the subtest level or enter subtest raw scores
- ▶ Online program converts raw scores to standard scores, percentiles, etc. for all scales.
- ▶ A narrative report with graphs and scores is provided

CAS2 Online Scoring and Report System (1-Year Base Subscription) (11/1/15)

This product requires a check of customer qualifications. Click here to download qualification forms: 10/08/09, CAS2, 080-900-3200.

Price: \$159.00

NEW

NOW AVAILABLE!

Agers: 5 through 18 years
 Testing Time: 40 to 60 minutes
 Administration: Individual

The new PC, Mac™, and iPad™ compatible CAS2 Online Scoring and Report System program is an efficient system program to quickly check and save away for corresponding narrative.

ORDERING OPTIONS:

- CAS2 Online Scoring and Report System (1-Year Subscription) \$159.00
- CAS2 Online Scoring and Report System (Actual Scores) \$69.00

Use CAS2 Online Scoring and Report System for:

- converting CAS2 subtest raw scores into standard scores, percentile ranks, descriptive terms, and age equivalents
- generating PASS and Full Scale composite scores;
- converting CAS2 subtest and PASS scale scores to identify significant intra-individual differences;
- providing a self report of CAS2 performance; and
- Sample Interpretive Report

Ordering options:

- CAS2 Online Scoring and Report System that time base subscription provides one year unlimited online scores and report access for up to 1 users.
- Annual base subscription provides one year unlimited online scoring and report access for up to 5 users.

CAS2 Online Score & Report

- As values are entered the program completes the record form
- Supplemental scales are automatically computed
 - Executive Function
 - Working Memory
 - Verbal
 - Nonverbal

CAS2 Cognitive Assessment System Second Edition

Scoring and Interpretive Report
 Jack A. Naglieri

Name: Jack Nag
 Age: 8
 Gender: Male
 Date of Birth: 07-12-2005
 Grade: 5
 School: East Lake

This computerized report is intended for use by qualified individuals. Information can be found in the CAS2 Interpretive Manual.

PASS and Full Scale Scores

Jack earned a Cognitive Assessment System, Second Edition (CAS2) Full Scale score of 105, which is within the Average classification and is a percentile rank of 83. This means that his performance is equal to or greater than that of 83% of children his age in the standardization group. There is a 90% probability that Jack's true Full Scale score falls within the range of 101 to 109. The CAS2 Full Scale score is made up of separate scales called Planning, Attention, Simultaneous, and Successive cognitive processing. Because there was significant variation among the PASS scales, the Full Scale will sometimes be higher and other times lower than the four scales in this test. The Attention Scale was found to be a significant cognitive strength. This means that Jack's Attention score was a strength both in relation to his average PASS scores and when compared to his peers. This cognitive strength has important implications for instructional and educational programming.

CAS2 Online Report Text

FULL SCALE

Jack earned a Cognitive Assessment System, Second Edition (CAS2) Full Scale score of 105, which is within the Average classification and is a percentile rank of 83. This means that his performance is equal to or greater than that of 83% of children his age in the standardization group. There is a 90% probability that Jack's true Full Scale score falls within the range of 101 to 109. The CAS2 Full Scale score is made up of separate scales called Planning, Attention, Simultaneous, and Successive cognitive processing. Because there was significant variation among the PASS scales, the Full Scale will sometimes be higher and other times lower than the four scales in this test. The Attention Scale was found to be a significant cognitive strength. This means that Jack's Attention score was a strength both in relation to his average PASS score and when compared to his peers. This cognitive strength has important implications for instructional and educational programming.

CAS2 Cognitive Assessment System Second Edition

Scoring and Interpretive Report
 Jack A. Naglieri

Name: Jack Nag
 Age: 8
 Gender: Male
 Date of Birth: 07-12-2005
 Grade: 5
 School: East Lake

This computerized report is intended for use by qualified individuals. Information can be found in the CAS2 Interpretive Manual.

Supplemental Composite Scores

VISUAL-AUDITORY COMPARISON

Jack's scores on the subjects in the Successive processing scale that involved visual (Visual Digit Span) or auditory (Word Series) presentation of information were compared to determine if the difference in the modality of the task may have had relevance. There was a significant difference between the two subjects that measured Successive processing when the information was given using an auditory (Word Series) or visual (Visual Digit Span) presentation. Jack's score of 5 on the visual subject falls within the Floor distribution and is significantly lower than his score of 10 on the auditory subject which falls within the Average classification. This information may have educational and therapeutic implications, and further exploration may be warranted.

CAS2 Online Score & Report

Online program includes PASS handouts from Helping Children Learn (2nd Edition) in English and Spanish

157

CAS2: Brief for ages 4-18 years

158

CAS2: Brief

- Give in 20 minutes
- Good for reevaluations
- Yields PASS and Total standard scores (Mn 100, SD 15)
- All items are different from CAS2
 - Planned Codes
 - Simultaneous Matrices
 - Expressive Attention
 - New Subtest
 - Successive Digits (forward only)

Figure 3.1. Example of page 1 of the CAS2: Brief Examiner Record Form, completed for Tommy.

159

CAS2: Brief Scale

- Planned Codes is used for Planning ability
- Eight items using numbers not letters as in CAS2 and different orientation of the pages

160

CAS2: Brief Simultaneous Matrices

ADMINISTRATION: Age-based entry points; apply ceiling (rolling of 4; basal of 2, if needed)

MATERIALS: CAS2: Brief Stimulus Book (pp. 1-90); 4/2 pencils

OBJECTIVE: Examinees should select the option that best completes the matrix.

ENTRY POINTS AND BASALS: If an examinee age 4-18 fails the first item, administer previous items in reverse order until two consecutive correct answers have been obtained (basal). Record the response in the appropriate column, and then score the response (1 = correct, 0 = incorrect) for each item.

DISCONTINUE RULE: Discontinue subtest if examinee receives four consecutive incorrect responses.

DIRECTIONS FOR ALL EXAMINEES: Show example in the CAS2: Brief Stimulus Book (p. 1) and say, "Look at this page. There is a piece missing here (point to the question mark). Which one of these (point to the five options in a sweeping motion) goes here? (Point to the question mark.) If the response is correct, say, 'Yes, that's the right one because it's all yellow. If incorrect, point to Option 3 and say, 'This is the right one because it's all yellow. (If necessary, provide a brief explanation.) Continue with directions for the appropriate age group."

DIRECTIONS FOR EXAMINEES AGES 4-18: Show item 1 and say, "Look at this page. There is a piece missing here."

161

CAS2: Brief Scale

- Expressive Attention (Stroop) used
- Big/Little animals (ages 4-7 years)
- Color Words (ages 8-18)

162

CAS2: Brief Planned Codes & Successive Digits

- Planned Codes has 8 items using numbers not letters and has different patterns
- Successive Digits uses numbers (not words)

Directions for Reported Strategies:
After all item sets have been completed, with item Set 6 still showing, say, Tell me how you did these. Indicate the pages in the Student Response Booklet just completed by the examinee. If necessary, say, How did you complete the pages? You may briefly clarify the question, provided that you give no examples. Record the examinee's reported strategies in the "Reported" column of the Strategy Checklist, as applied to each item set.

Item Set	Time Limit	Time in Seconds	Accuracy Score (Number Correct)	Ratio Score (see pages 9-11)
1	4:07 (0:00)			
Example A				
2	4:07 (0:00)			
Example B				
3	4:07 (0:00)			
Example C				
4	4:07 (0:00)			
Example D				
5	4:07 (0:00)			
6	4:07 (0:00)			

Raw Score (sum of ratio scores)

Strategy Checklist		
Observed	Reported	Description of Strategy
		1. Coded left to right, top to bottom
		2. Coded codes left out first
		3. Coded one letter at a time (e.g., did A, then B)
		4. Coded words and slowly
		5. Used a pattern from a previous item
		6. Looked for the pattern in the items
		7. Looked at codes already completed, rather than using the key

CAS2: Rating Scale

Structure and features

Cognitive Assessment System: Rating Scale
SECOND EDITION

Examiner's Manual

CAS2 Rating Scales (Ages 4-18 yrs.)

- The CAS2: Rating measures behaviors associated with PASS constructs
- Normed on a nationally representative sample of 1,383 students rated by teachers

CAS2 Rating Scales

- The CAS2: Rating form contains 40 items
- 10 items for each PASS scale
- PASS and Total scales are set to have a mean of 100 and standard deviation of 15

CAS2 Rating Scales

- The rater is given a description of what each scale is intended to measure.
- This informs teachers about PASS

Directions for Items 1-10. These questions ask how well the child or adolescent decides how to do things to achieve a goal. They also ask how well a child or adolescent thinks before acting and avoids impulsivity. Please rate how well the child or adolescent creates plans and strategies to solve problems.

Directions for Items 11-20. These questions ask how well the child or adolescent sees how things go together. They also ask about working with diagrams and understanding how ideas fit together. The questions involve seeing the whole without getting lost in the parts. Please rate how well the child or adolescent visualizes things as a whole.

Directions for Items 21-30. These questions ask how well the child or adolescent pays attention and resists distractions. The questions also ask about how well someone attends to one thing at a time. Please rate how well the child or adolescent pays attention.

Directions for Items 31-40. These questions ask how well the child or adolescent remembers things in order. The questions ask about working with numbers, words, or ideas in a series. The questions also ask about doing things in a certain order. Please rate how well the child or adolescent works with things in a specific order.

CAS2 Rating Scales

- The CAS2: Rating Scale scores can be used as part of a larger comprehensive evaluation or for instructional planning

Section 3. PASS Scale and Total Score Summary

Item Set	Raw Score	Ratio Score	Standard Score
Planning	14	95	
Organization	21	105	
Attention	24		100
Suppression	11		85
Total Score			95

Standard Score: 95 (15) 100 (0) 105 (15) 110 (30) 115 (45) 120 (60) 125 (75) 130 (90) 135 (105) 140 (120) 145 (135) 150 (150)

Section 4. PASS Scale and Total Score Profile

Section 5. PASS Scale Comparisons

Item Set	Standard Score	Color	Strength	Weakness
Planning	95	Red	100	100
Organization	105	Green	100	100
Attention	100	Yellow	100	100
Suppression	85	Blue	100	100

Section 6. Descriptive Terms

Descriptive Terms	Very Poor	Poor	Below Average	Average	Above Average	Superior	Very Superior
Standard and Total Score	<70	70-79	80-89	90-109	110-119	120-129	≥130

Figure 2.3. Sample page 4 of Rating Form, completed for Tommy.

PASS: Across the Three Measures

	CAS2 Rating Scale Items ask how well the child...	CAS2	CAS2 Brief
Planning	thinks before acting, creates plans, uses strategies to achieve a goal.	Planned Codes Planned Connections Planned Number Matching	Planned Codes
Attention	can focus attention to one thing at a time and resists distractions.	Expressive Attention Receptive Attention	Expressive Attention
Simultaneous	understands how parts combine to make a whole and see the big picture.	Matrices Verbal-Spatial Relations Figure Memory	Simultaneous Matrices
Successive	works with numbers, words or ideas that are arranged in a specific series.	Word series Sentence Repetition/Questions Visual Digit Span	Successive Digits

SLD and Basic Psychological Processes

- ▶ The IDEA definition of SLD is
 - "... a disorder in 1 or more of the basic psychological processes involved in understanding or in using language, spoken or written, which disorder may manifest itself in the imperfect ability to listen, think, speak, read, write, spell, or do mathematical calculations."
- ▶ **Measuring basic psychological processes is essential** to address the SLD definition
- ▶ School psychologists should choose wisely when selecting a measure of basic psychological processes
