**The test we use to
assess ability matters!**

Case of Alejandro

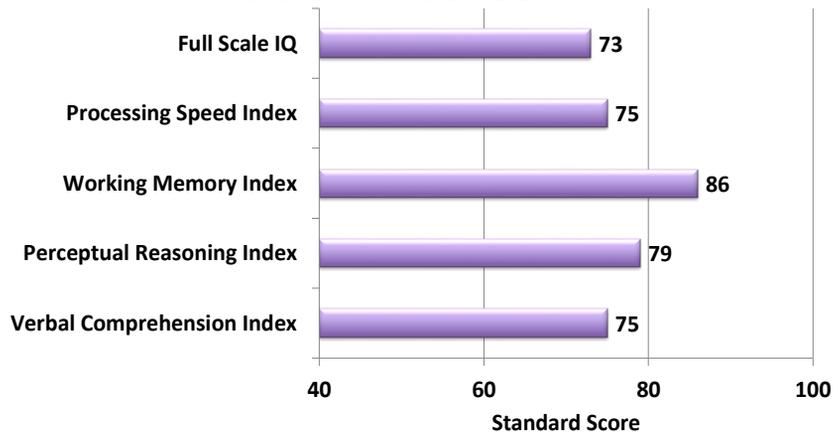

Note: this is not a picture of Alejandro

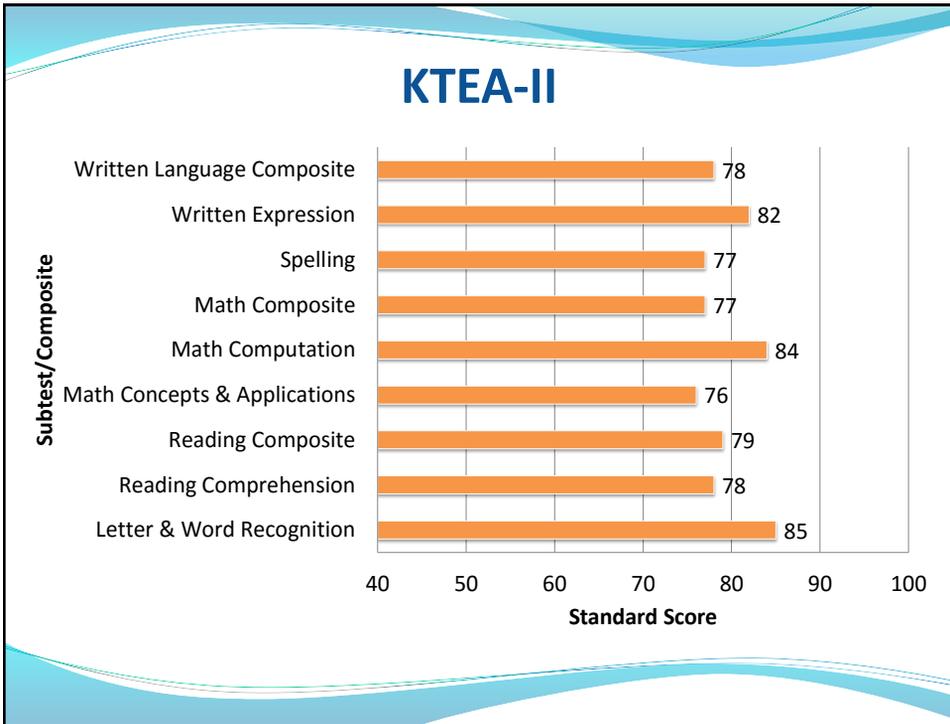

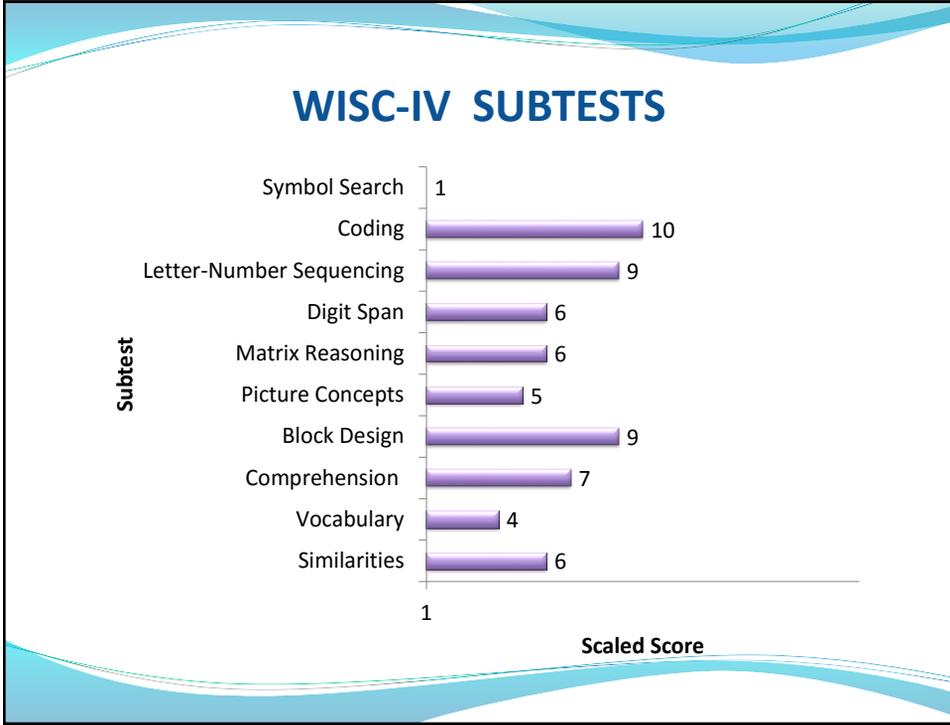

CASE STUDY: ALEJANDRO (C.A. 7-0 GRADE 1)

REASON FOR REFERRAL

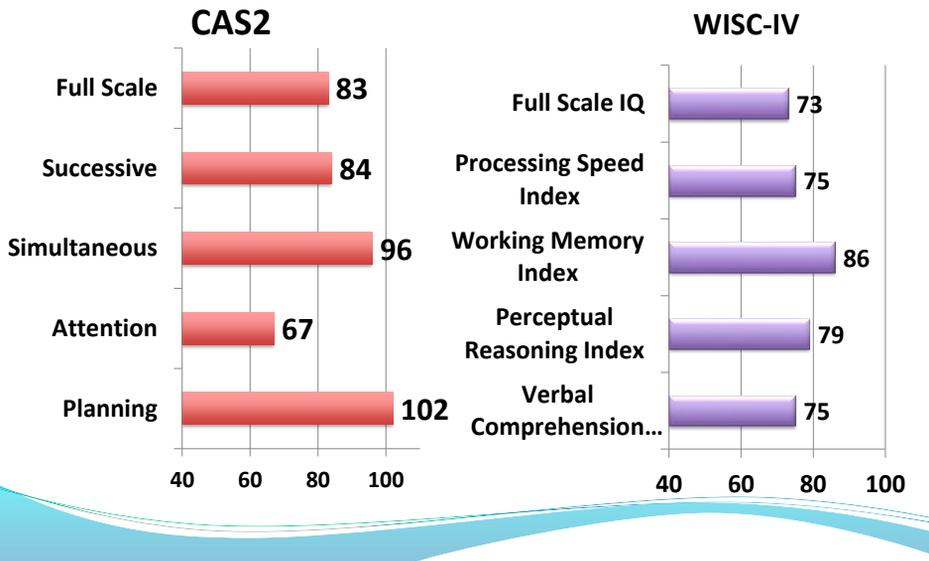

- Academic:
 - Could not identify letters/sounds
 - October 2013: Could only count to 39
 - All ACCESS scores of 1
- Behavior:
 - Difficulty following directions
 - Attention concerns
 - Refusal/defiance

WISC-IV ASSESSMENT

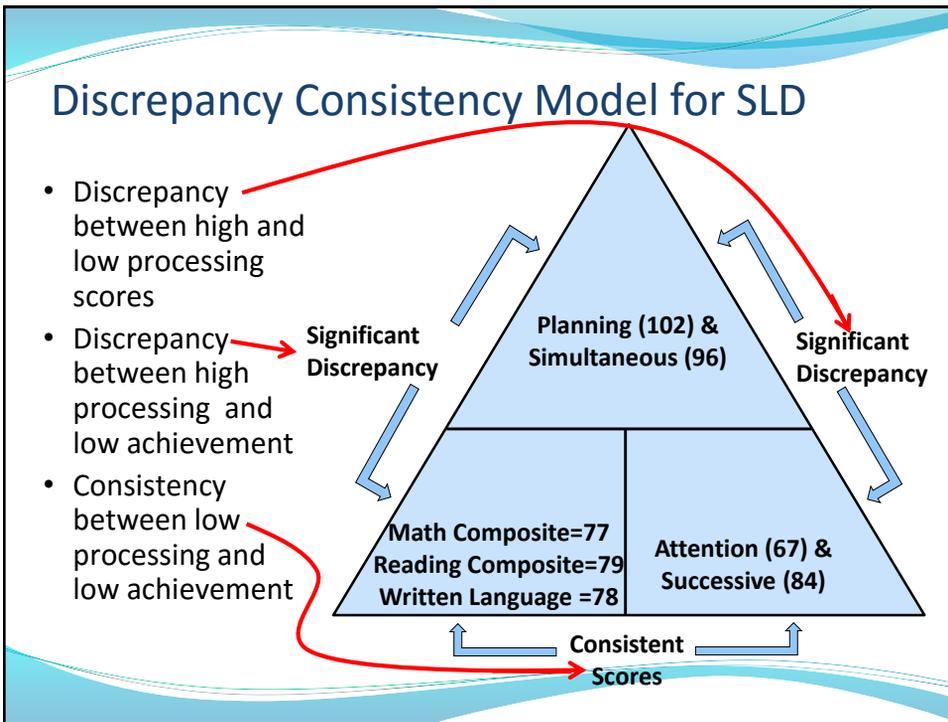

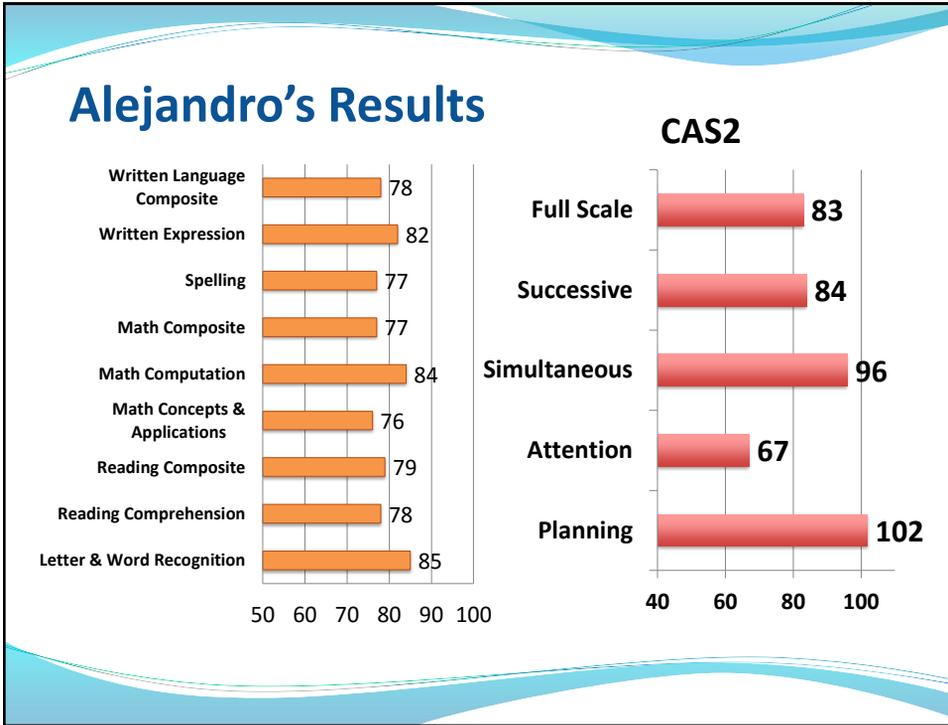

PASS basic psychological processes

Thoughts about Alejandro

- We want to help our students, but how?
- What have tried to get information from the Wechsler Scales
 - Subtest analysis (doesn't work)
 - Interpretation of subtests according to other views (Working Memory, Speed, CHC, etc.) -doesn't work
- Which test/method should we use?
- All these questions will be answered...

The test we use can alter a student's self-image!

Case of Alejandro

Note: this is not a picture of Alejandro

A Modern Measure of Ability

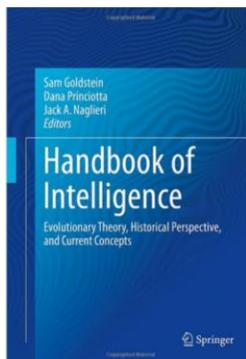

- Use a test based on a brain-based theory
- The theory and the test must
 - be non-discriminatory
 - yield profiles that can be used for identification
 - have instructional implications

Non-discriminatory Tests

This is essential for accurate assessment

Evolution of IQ (Goldstein, Princiotta & Naglieri, 2015)

Hundred Years of Intelligence Testing: Moving from Traditional IQ to Second-Generation Intelligence Tests

20

Jack A. Naglieri

"Do not go where the path may lead, go instead where there is no path and leave a trail."

—Ralph Waldo Emerson

Context

April 6, 1917, is remembered as the day the United States entered World War I. On that same day a group of psychologists held a meeting in Harvard University's Emerson Hall to discuss the possible role they could play with the war effort (Yerkes 1921). The group agreed that psychological knowledge and methods could be of importance to the military and utilized to increase the efficiency of the Army and Navy personnel. The group included Robert Yerkes, who was also the president of the American Psychological Association. Yerkes made an appeal to members of APA who responded by

Training School in Vineland, New Jersey, on May 28. The committee considered many types of group tests and several that Arthur S. Otis developed when working on his doctorate under Lewis Terman at Stanford University. The goal was to find tests that could efficiently evaluate a wide variety of men, be easy to administer in the group format, and be easy to score. By June 9, 1917, the materials were ready for an initial trial. Men who had some educational background and could speak English were administered the verbal and quantitative (Alpha) tests and those that could not read the newspaper or speak English were given the Beta tests (today described as nonverbal).

The Alpha tests were designed to measure general information (e.g., how many months are

Abstract

Hispanics have become the largest minority group in the United States. Hispanic children typically come from working class homes with parents who have limited English language skills and educational training. This presents challenges to psychologists who assess these children using traditional IQ tests because of the considerable verbal and academic (e.g., quantitative) content. Some researchers have suggested that intelligence conceptualized on the basis of psychological processes may have utility for assessment of children from culturally and linguistically diverse populations because verbal and quantitative skills are not included. This study examined Hispanic children's performance on the Cognitive Assessment System (CAS; Naglieri, J.A., and Das, J.P. (1997). Cognitive Assessment System. Itasca, IL: Riverside.) which is based on the Planning, Attention, Simultaneous, and Successive (PASS) theory of intelligence. The scores of Hispanic (N=244) and White (N=1956) children on the four PASS processes were obtained and the respective correlations between PASS and achievement compared. Three complementary sampling methodologies and data analysis strategies were chosen to compare the Ethnic groups. Sample size was maximized using nationally representative groups and demographic group differences were minimized using smaller matched samples. Small differences between Hispanic and non-Hispanic children were found when ability was measured with tests of basic PASS processes. In addition, the correlation between the PASS constructs and achievement were substantial for both Hispanic and non-Hispanic children and were not significantly different between the groups. This study compared the performance of 1 on the Planning, Attention, Simultaneous, Sured by English and Spanish versions o (CAS; Naglieri & Das, 1997a). The results s on both English and Spanish versions of n CAS, the bilingual children earned their to regardless of the language used during test ences were noted between the means of the 1 Simultaneous and Successive processing sca were similar. Specific subtests within the 2 were found to contribute to the difference versions of the CAS. Comparisons of the c ness on both versions of the CAS showed sistenty despite the language difference.

This study examined the performance of referred Hispanic English-language learners (N=40) on the English and Spanish versions of the Cognitive Assessment System (CAS; Naglieri & Das, 1997). The CAS measures basic neuropsychological processes based on the Planning, Attention, Simultaneous, and Successive (PASS) theory (Naglieri & Das, 1997; Naglieri & Otero, 2011c). Full Scale (FS) scores as well as PASS processing scale scores were compared, and no significant differences were found in FS scores or in any of the PASS processes. The CAS FS scores on the English (M = 86.4, SD = 8.73) and Spanish (M = 87.1, SD = 7.88) versions correlated .94 (uncorrected) and .99 (corrected for range restriction). Students earned their lowest scores in Successive processing regardless of the language in which the test was administered. PASS cognitive profiles were similar on English and Spanish versions of the PASS scales. These findings suggest that students scored similarly on both versions of the CAS and that the CAS may be a useful measure of these four abilities for Hispanic children with underdeveloped English-language proficiency.

CAS Full Scale = 86.4 in English and 87.1 in Spanish

CAS Full Scale = 84.6 in English and 87.6 in Spanish

Why Measure Basic Psych Processes?

- Measures of basic psychological processes in these measures assess abilities **without requiring knowledge**
 - Vocabulary
 - Arithmetic
 - Similarities
 - Comprehension
 - Information
- The knowledge requirement in traditional IQ tests distorts the measurement of ability

23

Time to Reflect

24

Presentation Outline

- Introduction

- A neurocognitive theory of Learning - PASS

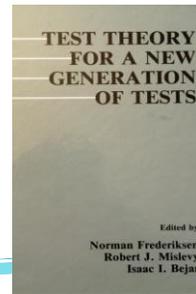

- complex decision making (frontal lobes – Planning)
- focus and resistance to distractions (brain stem - Attention)
- visual/verbal spatial ability (Occipital/Parietal - Simultaneous)
- visual/verbal sequencing (Temporal area - Successive)
- How to measure PASS
- Does PASS work?

Basic Psychological Processes

Connecting IDEA with practice

Defining basic psychological process

- ▶ How did we identify ‘basic psychological processes’?
 - We should use knowledge from cognitive and neuropsychology to construct a model to test
 - A well tested model can evolve into a THEORY of ‘basic psychological processes’
 - We should not assign new labels to traditional IQ subtests
 - We should recognize the limitations of developing a theory from factor analysis – *“a research program dominated by factor analyses of test intercorrelations is incapable of producing an explanatory theory of human intelligence”* (Lohman & Ippel, 1993, p. 41)

Defining basic psychological process

- The term ‘basic psychological processes’ is a modern term for ability (or intelligence) when traditional verbal tests that are confounded by knowledge (e.g., Information, Similarities, Arithmetic, Vocabulary) are excluded
- ‘basic psychological processes’ provide us the means to function and acquire knowledge and skills
 - ▶ Skills, like reading decoding, phonological coding, or math calculation, are *not* examples of a cognitive process
 - ▶ Skill = knowledge that is well learned and therefore can be performed with little thinking

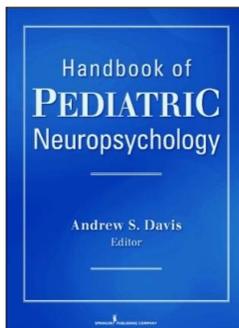

Cognition or Knowledge?

- What does the student have to **know** to complete a task?
 - This is dependent on *instruction*
- How does the student have to **think** to complete a task?
 - This is dependent on the *brain* – **'basic psychological processes'**
- We must assess ability and achievement separately

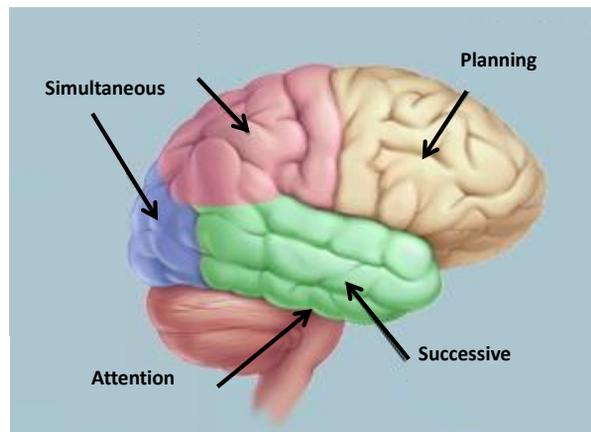

Brain, Cognition, & Intelligence

- The brain is the seat of abilities called PASS
- These basic psychological processes are the foundation of learning (Naglieri & Otero, 2011)

See Naglieri, J. A. & Otero, T. (2011). Cognitive Assessment System: Redefining Intelligence from A Neuropsychological Perspective. In A. Davis (Ed.), *Handbook of Pediatric Neuropsychology (320-333)*. New York: Springer Publishing.

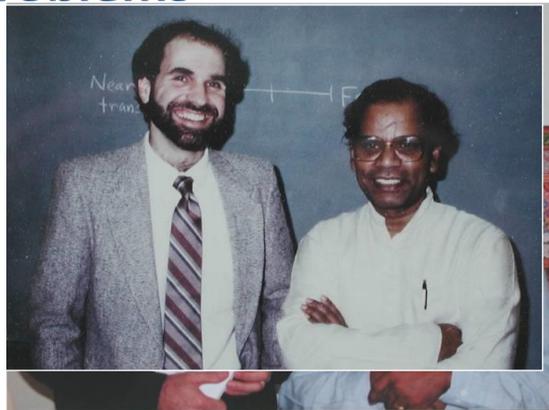

PASS & Basic Psychological Processes

- **P**lanning = THINKING ABOUT HOW YOU DO WHAT YOU DECIDE TO DO
- **A**ttention = BEING ALERT AND RESIST DISTRACTIONS
- **S**imultaneous = GETTING THE BIG PICTURE
- **S**uccessive = FOLLOWING A SEQUENCE

- **PASS theory** is a modern way to measure neurocognitive abilities related to brain function

31

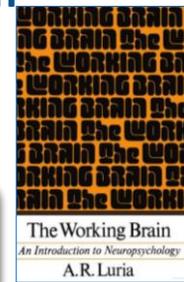

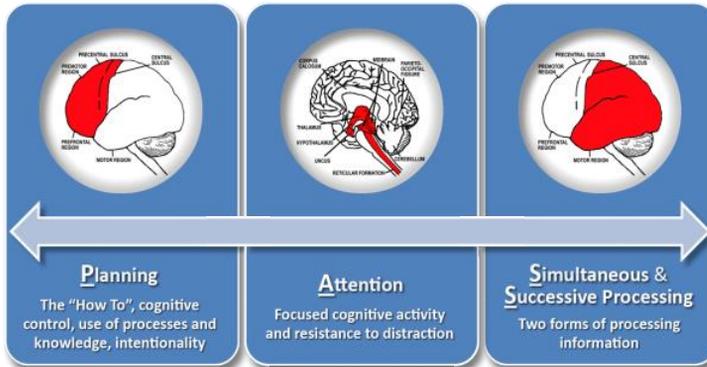

A Neurocognitive approach to understanding learning and learning problems

32

PASS: A neurocognitive approach

Three Functional Units described by A. R. Luria

33

PASS Theory

- ▶ **Planning** is a basic psychological process we use to determine, select, and apply efficient solutions to problems
 - problem solving
 - developing plans and using strategies
 - impulse control and self-control
 - control of processing
 - retrieval of knowledge

34

CAS2: Rating Scale Planning

Directions for Items 1–10. These questions ask how well the child or adolescent decides how to do things to achieve a goal. They also ask how well a child or adolescent thinks before acting and avoids impulsivity. Please rate how well the child or adolescent creates plans and strategies to solve problems.

During the past month, how often did the child or adolescent . . .

	Never	Barely	Sometimes	Frequently	Always
1. produce a well-written sentence or a story?	0	1	2	3	4
2. evaluate his or her own actions?	0	1	2	3	4
3. produce several ways to solve a problem?	0	1	2	3	4
4. have many ideas about how to do things?	0	1	2	3	4
5. have a good idea about how to complete a task?	0	1	2	3	4
6. solve a problem with a new solution when the old one did not work?	0	1	2	3	4
7. use information from many sources when doing work?	0	1	2	3	4
8. effectively solve new problems?	0	1	2	3	4
9. have well-described goals?	0	1	2	3	4
10. consider new ways to finish a task?	0	1	2	3	4

Math Strategies

Note to the Teacher:
When we teach children skills by helping them use strategies and plans for learning, we are teaching both knowledge and processing. Both are important.

Doubles and Near Doubles

double
 $8 + 8 = 16$

How many are there? near double
 $8 + 9 = 17$

Ring the double. Add.

1. $6 + 6 = 12$
 $6 + 7 = 13$

2. $5 + 5 = 10$
 $5 + 6 = 11$

3. $7 + 7 = 14$
 $7 + 8 = 15$

4. $4 + 4 = 8$
 $4 + 5 = 9$

CHECK If you know the sum of 8 + 8, how can you find 8 + 9?

three hundred thirty-five 335

PASS Theory: Planning

Planning

- Evaluate a task
- Select or develop a strategy to approach a task
- Monitor progress during the task
- Develop new strategies when necessary

Examples of classroom problems related to Planning

- using the same strategy even if it is not effective
- Struggling with how to complete tasks
- Not monitoring progress during a task
- Misinterpretation of what is read

Naglieri, J. and Pickering, E., *Helping Children Learn*, 2003

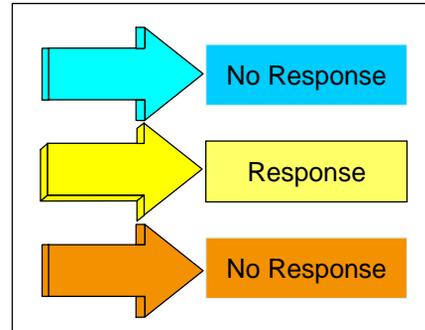

- Your thoughts???

PASS Theory

- ▶ **Attention** is a basic psychological process we use to selectively attend to some stimuli and ignores others
 - focused cognitive activity
 - selective attention
 - resistance to distraction

RED
BLUE

41

CAS2: Rating Scale Attention

Directions for Items 21–30. These questions ask how well the child or adolescent pays attention and resists distractions. The questions also ask about how well someone attends to one thing at a time. Please rate how well the child or adolescent pays attention.

During the past month, how often did the child or adolescent . . .

	Never	Rarely	Sometimes	Frequently	Always
21. work well in a noisy area?	0	1	2	3	4
22. stay with one task long enough to complete it?	0	1	2	3	4
23. not allow the actions or conversations of others to interrupt his or her work?	0	1	2	3	4
24. stay on task easily?	0	1	2	3	4

44

PASS Theory: Attention

Attention

- Focus on one thing and ignore others
- Resist distractions in the learning environment

Examples of classroom problems related to Attention

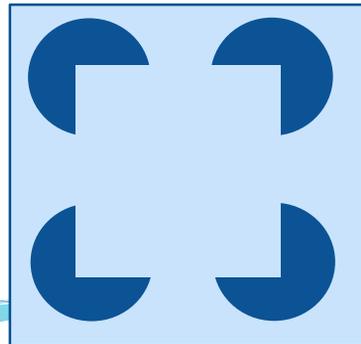

- Trouble focusing on what is important
- Difficulty resisting distractions
- Difficulty working on the same task for very long
- Unable to see all the details
- Providing incomplete or partially wrong answers

Naglieri, J. and Pickering, E., *Helping Children Learn*, 2003

PASS Theory

- **Simultaneous** is a basic psychological process which we use to integrate stimuli into groups
 - Stimuli are seen as a whole
 - Each piece must be related to the others
 - Content is not relevant

CAS2: Rating Scale Simultaneous

Directions for Items 11–20. These questions ask how well the child or adolescent sees how things go together. They also ask about working with diagrams and understanding how ideas fit together. The questions involve seeing the whole without getting lost in the parts. Please rate how well the child or adolescent visualizes things as a whole.

During the past month, how often did the child or adolescent . . .

	Never	Rarely	Sometimes	Frequently	Always
11. like to draw designs?	0	1	2	3	4
12. figure out how parts of a design go together?	0	1	2	3	4
13. classify things into groups correctly?	0	1	2	3	4
14. work well with patterns and designs?	0	1	2	3	4
15. see how objects and ideas are alike?	0	1	2	3	4
16. work well with physical objects?	0	1	2	3	4
17. like to use visual materials?	0	1	2	3	4
18. see the links among several things?	0	1	2	3	4
19. show interest in complex shapes and patterns?	0	1	2	3	4
20. recognize faces easily?	0	1	2	3	4

CAS2 Verbal-Spatial Relations

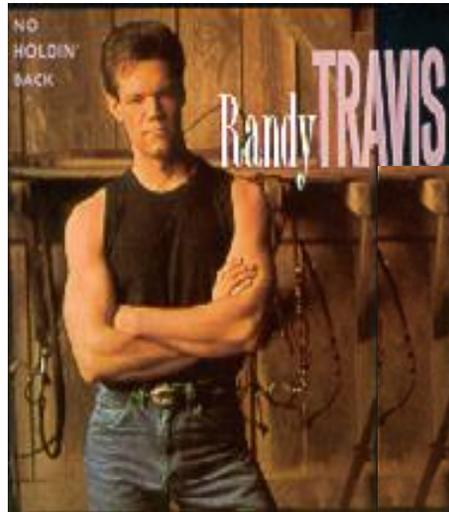

Which picture shows a boy behind a girl?

Simultaneous Verbal Task

- Simultaneous processing using verbal content
- Who is this song about?

My momma's daddy was his oldest son.

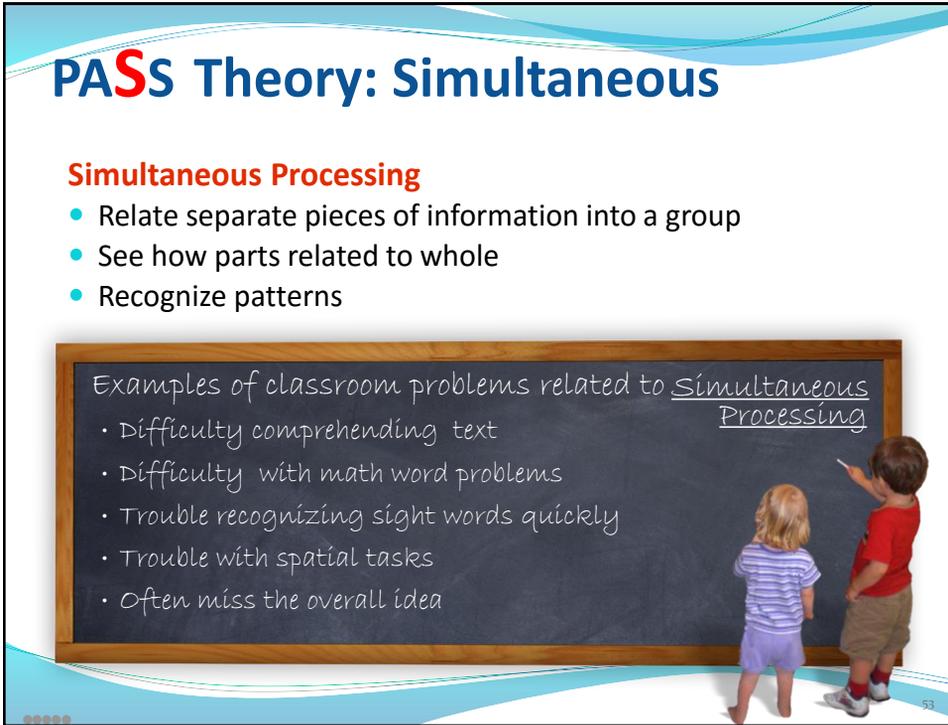

PASS Theory: Simultaneous

Simultaneous Processing

- Relate separate pieces of information into a group
- See how parts related to whole
- Recognize patterns

Examples of classroom problems related to Simultaneous Processing

- Difficulty comprehending text
- Difficulty with math word problems
- Trouble recognizing sight words quickly
- Trouble with spatial tasks
- Often miss the overall idea

Numbers from 1 to 100

Simultaneous processing is used in this work sheet because it helps the child see the patterns in the math

Name Jack Secret number _____

- Your thoughts???

Modern Theory: Successive

- ▶ **Successive** processing is a basic psychological process we use to manage stimuli in a specific serial order
 - Stimuli form a chain-like progression
 - Stimuli are not inter-related

The child answers a question about a statement read by the examiner such as:

**The red greened the blue with a yellow.
Who got greened?**

CAS2: Rating Scale Successive

Directions for Items 31–40. These questions ask how well the child or adolescent remembers things in order. The questions ask about working with numbers, words, or ideas in a series. The questions also ask about doing things in a certain order. Please rate how well the child or adolescent works with things in a specific order.

During the past month, how often did the child or adolescent . . .

	Never	Rarely	Sometimes	Frequently	Always
31. recall a phone number after hearing it?	0	1	2	3	4
32. remember a list of words?	0	1	2	3	4
33. sound out hard words?	0	1	2	3	4
34. correctly repeat long, new words?	0	1	2	3	4
35. remember how to spell long words after seeing them once?	0	1	2	3	4
36. imitate a long sequence of sounds?	0	1	2	3	4
37. recall a summary of ideas word for word?	0	1	2	3	4
38. repeat long words easily?	0	1	2	3	4

Successive Raw Score

Jack A. Naglieri, Ph.D. jnaglier@gmu.edu

57

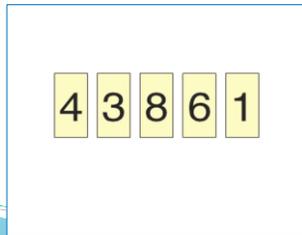

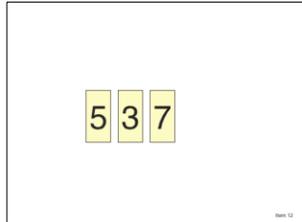

Word Series, Sentence Repetition (Ages 5-7) or Sentence Questions (Ages 8-17)

- Word Series
 - Child repeats high imagery single syllable words presented at 1 per second
- Sentence Repetition
 - Child repeats sentences exactly as stated by the examiner such as:
 - The red greened the blue with a yellow.
- Sentence Questions
 - Child answers a question about a statement made by the examiner such as:
 - The red greened the blue with a yellow. Who got greened?

58

CAS2

- Visual Digit Span subtest allows for a Visual Auditory comparison

59

Successive

The sequence of the sounds is emphasized in this work sheet - this requires successive processing

Aa ---

Ants accept award ---

Active ants applaud ---

Annie ate apples ---

60

Learning Math Facts

$$8 + 9 = 17$$

$$8 + 9 = 17$$

$$8 + 9 = 17$$

PASS Theory: Successive

Successive Processing

- Use information in a specific order
- Follow instructions presented in sequence

Examples of classroom problems related to Successive Processing

- Trouble blending sounds to make words
- Difficulty remembering numbers in order
- Reading decoding problems
- Difficulty remembering math facts when they are taught using rote learning ($4 + 5 = 9$).

Naglieri, J. and Pickering, E., *Helping Children Learn*, 2003

CAS2 Online Score & Report

<http://www.proedinc.com/customer/ProductView.aspx?ID=7277>

- ▶ Enter data at the subtest level or enter subtest raw scores
- ▶ Online program converts raw scores to standard scores, percentiles, etc. for all scales.
- ▶ A narrative report with graphs and scores is provided

CAS2: Online Scoring and Report System (1-Year Base Subscription) (14311)
This product requires a check of customer qualifications. Click [here](#) to download qualifications form. TO ORDER, CALL: 800-897-3202.

Price: \$199.00

NEW

NOW AVAILABLE!

Ages: 5 through 18 years
Testing Time: 40 to 60 minutes
Administration: Individual

The new PC, Mac™, and iPad™ compatible CAS2 Online Scoring and Report System program is an efficient and easy way to obtain CAS2 scores and corresponding narrative.

Use CAS2 Online Scoring and Report System for:

- converting CAS2 subtest raw scores into standard scores, percentile ranks, descriptive terms, and age equivalents;
- generating PASS and Full Scale composite scores;
- comparing CAS2 subtest and PASS scale scores to identify significant intra-individual differences;
- providing a pdf report of CAS2 performance; and
 - [Sample Interpretive Report](#)
 - [Sample Score Summary](#)
- providing intervention options.

Ordering options:

- CAS2 Online Scoring and Report System first-time base subscription provides one-year unlimited online scoring and report access for up to 5 users.
- Annual base subscription renewal provides one-year unlimited online scoring and report access for up to 5 users.

ORDERING OPTIONS:

- CAS2: Online Scoring and Report System (Add-on 5-User License) **\$69.00**
- CAS2: Online Scoring and Report System (Annual Renewal) **\$69.00**

CAS2 Online Score & Report

- Narrative report can be obtained in Word or PDF

Scoring and Interpretive Report
Jack A. Naglieri

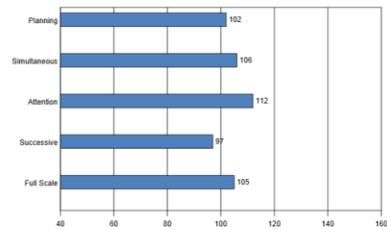

Name: Jack Nag
Age: 8
Gender: Male
Date of Birth: 07-12-2005
Grade: 5
School: East Lake

This computerized report is intended for use by qualified individuals. Information can be found in the CAS2 Interpretive Manual.

FULL SCALE

Jack earned a Cognitive Assessment System, Second Edition (CAS2) Full Scale score of 105, which is within the Average classification and is a percentile rank of 63. This means that his performance is equal to or greater than that of 63% of children his age in the standardization group. There is a 90% probability that Jack's true Full Scale score falls within the range of 101 to 109. The CAS2 Full Scale score is made up of separate scales called Planning, Attention, Simultaneous, and Successive cognitive processing. Because there was significant variation among the PASS scales, the Full Scale will sometimes be higher and other times lower than the four scales in this test. The Attention Scale was found to be a significant cognitive strength. This means that Jack's Attention score was a strength both in relation to his average PASS score and when compared to his peers. This cognitive strength has important implications for instructional and educational programming.

PASS and Full Scale Scores

Provide Help

The examiner can explain the demands of the task in any manner deemed appropriate and in any language

Item Set 1

Expose Item Set 1 and say,

Look at this page. There are many boxes for you to fill in (point to the portion of the page with the empty boxes, but do not point in a sweeping motion to the rows or columns). **Fill in as many of these as you can, as fast as you can, using these answers** (point to the coded boxes, and pause for 3-5 seconds to allow the examinee to look at the page). **You can do it any way you want. Let's see how many you can do.**

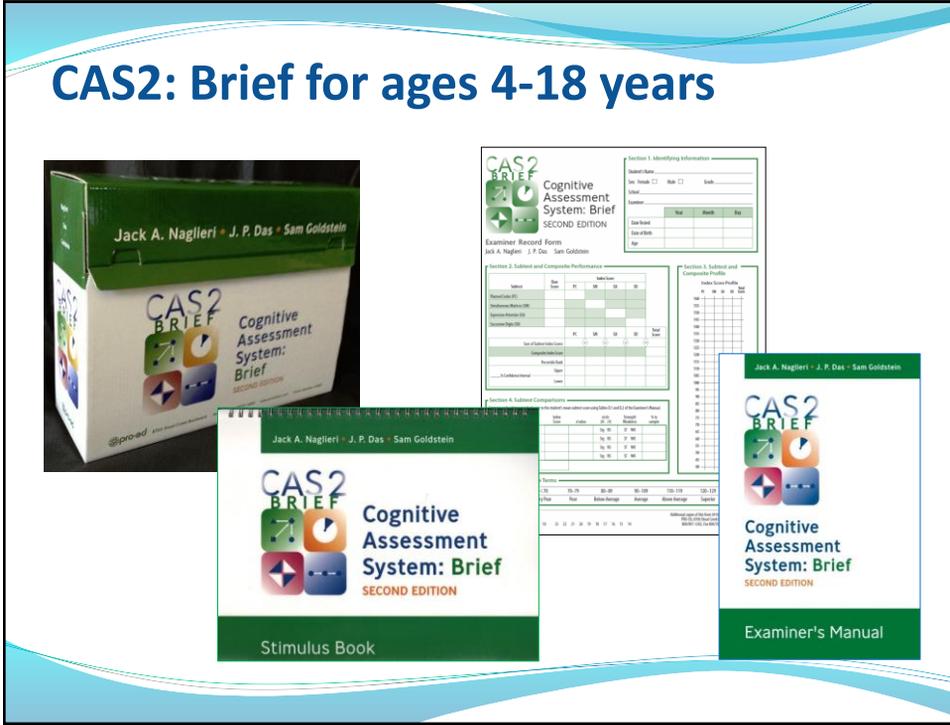

Ready? (Provide a brief explanation if necessary.)

Begin. Start timing. Allow 60 seconds (1:00 minute). Record the time to completion and strategy use.

If the examinee stops or spends more than 1 or 2 seconds erasing, immediately say, **Keep going.**

If the examinee is still working after the time limit expires, say, **Stop.** Record the time in seconds. Note strategy use.

CAS2: Brief for ages 4-18 years

CAS2: Brief

- Give in 20 minutes
- **Good for reevaluations**
- Yields PASS and Total standard scores (Mn 100, SD 15)
- All items are different from CAS2
 - Planned Codes
 - Simultaneous Matrices
 - Expressive Attention
- New Subtest
 - Successive Digits (forward only)

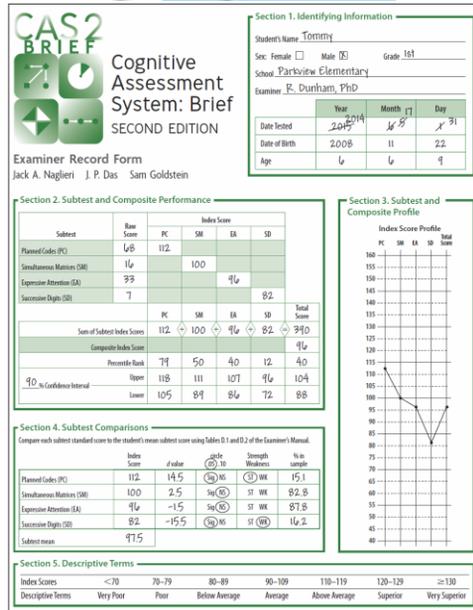

Figure 3.1. Example of page 1 of the CAS2: Brief Examiner Record Form, completed for Tommy.

CAS2: Brief Simultaneous Matrices

Simultaneous Matrices

Administration:

Age-based entry points; apply ceiling (ceiling of 4; basal of 2, if needed)

Materials:

CAS2: Brief Stimulus Book (pp. 1–90); #2 pencils

Objective:

Examinees should select the option that best completes the matrix.

Entry Points and Basals: If an examinee age 12–18 fails the first item, administer previous items in reverse order until two consecutive correct answers have been obtained (basal). Record the response in the appropriate column, and then score the response (1 = correct, 0 = incorrect) for each item.

Discontinue Rule: Discontinue subtest if examinee receives four consecutive incorrect responses.

Directions for All Examinees:

Show example in the CAS2: Brief Stimulus Book (p. 1), and say, *Look at this page. There is a piece missing here (point to the question mark). Which one of these (point to the five options in a sweeping motion) goes here? (Point to the question mark.) If the response is correct, say, Yes, that's the right one because it's all yellow. If incorrect, point to Option 3 and say, This is the right one because it's all yellow. (If necessary, provide a brief explanation.) Continue with directions for the appropriate age group.*

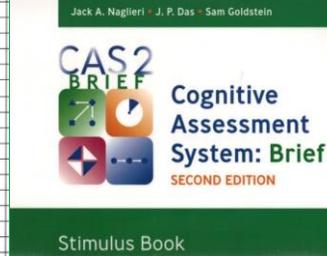

Directions for Examinees Ages 4–11:

Show item 1 and say, *Look at this page. There is a piece missing here.*

Directions for the Remaining Items:

For each item, say as needed, *There is a piece missing here (point to the question mark). Which one of these (point to the options in a sweeping motion) goes here? (Point to the question mark.) When the question is no longer necessary, say, Now do this one. (Provide no additional help.) If the examinee does not respond after about 60 seconds, encourage him or her to choose one of the options. If the examinee still does not respond, say, Let's try the next one. (Show the next item.)*

CAS2 Rating Scales (Ages 4-18 yrs.)

- The CAS2: Rating measures behaviors associated with PASS constructs
- Normed on a nationally representative sample of 1,383 students rated by teachers

CAS2 Rating Scales

- The CAS2: Rating form contains 40 items
- 10 items for each PASS scale
- PASS and Total scales are set to have a mean of 100 and standard deviation of 15

CAS2 Cognitive Assessment System: Rating Scale
SECOND EDITION

Section 1. Identifying Information

Student's Name: _____ Sex: Male Female Other Grade: _____
 School: _____
 Room Number: _____
 Room Title: _____
 Rate the student's behavior for _____ (past month)
 Date of Rating: _____ Year _____ Month _____ Day _____
 Date of Birth: _____
 Age: _____
 Examiner's Name: _____
 Examiner's Title: _____

Section 2. Rating Instructions and Scales

The CAS2 Rating Scale is designed to assess classroom behaviors seen by a teacher who has had at least 4 weeks of experience with the student. The behaviors are organized into four groups, which will be used to obtain scores for four different scales. Each scale contains 10 questions that are scored on the basis of how often specific behaviors were seen. The scores for each question range from never to always.

To complete the form, read each statement that follows the phrase, "During the past month, how often did the child or adolescent...". Then circle the number under the word that tells how often the behavior was seen. Read each question carefully. Then mark how often the behavior was seen in the past month. Answer every question without skipping any. If you want to change your answer, put an X through it and circle your new choice. Be sure to answer every question.

Teachers should rate all items to the best of their ability, given their knowledge of the student and the student's peers. In some cases, teachers may have only indirect knowledge of the student's performance; nonetheless, the teacher should provide the best rating possible.

It is important that ratings should be based on the student's behavior regardless of the language or medium used.

Additional copies of this form of CAS2 may be purchased from: www.nesinc.com. Phone: 781-339-1000

Test Profile and SLD

CHAPTER 1

PSYCHOLOGICAL ASSESSMENT BY SCHOOL PSYCHOLOGISTS: OPPORTUNITIES AND CHALLENGES OF A CHANGING LANDSCAPE

Jack A. Naglieri

The reliability and validity of information obtained from any psychological test is dependent on the in school psychological practice, as described by the National Association of School Psychologists (2010). The goal of this chapter is not to summarize all the changes that have recently occurred or to predict the outcomes of these changes but rather to summarize a few important issues related to the current state of the field and the apparent strengths and weaknesses of the various options.

INTELLIGENCE AND SPECIFIC LEARNING DISABILITIES

Controversy is not new to the construct of intelligence and its measurement (see Jensen, 1998). Arguments have raged about the nature of intelligence—is it one factor or multiple factors, are intelligence tests biased or not, what are the best ways to interpret test results, do children with specific disabilities have distinctive ability profiles, and do intelligence test scores have relevance beyond diagnostic classifica-

APA Handbook of Testing and Assessment in Psychology

CHAPTER 6

Assessment of Cognitive and Neuropsychological Processes

JACK A. NAGLIERI
SAM GOLDSSTEIN

INTRODUCTION

Assessment of intelligence plays an important role in the process of determining if an adolescent or adult has a disability. For those suspected of having a Specific Learning Disability (SLD), the intelligence test provides an input to levels of achievement. For those who may have Attention Deficit/Hyperactivity Disorder (ADHD), the measure of intelligence is used to may better explain the person's behavior. Intelligence provides a critical component of any comprehensive assessment of the presence of disabilities, such as SLD and ADHD, demands a thorough understanding of the strengths and abilities, an appreciation of the research on their effect of modern views of assessing intelligence. The goal of these issues.

This chapter reexamines intelligence as measured by school attention to the utility such tests have for diagnosis the chapter includes a brief overview of the history and examines examples of measures of intelligence in placed on the importance of understanding how intelligence measured by different tests and the implications this has also provides a conceptual model of assessment of basic how that information can aid in the diagnostic process and adults.

Learning and Attention Disorders in Adolescence and Adulthood

Assessment and Treatment

EDITED BY SAM GOLDSSTEIN · JACK A. NAGLIERI · MELISSA DAVRIES

84

Naglieri & Goldstein (2011)

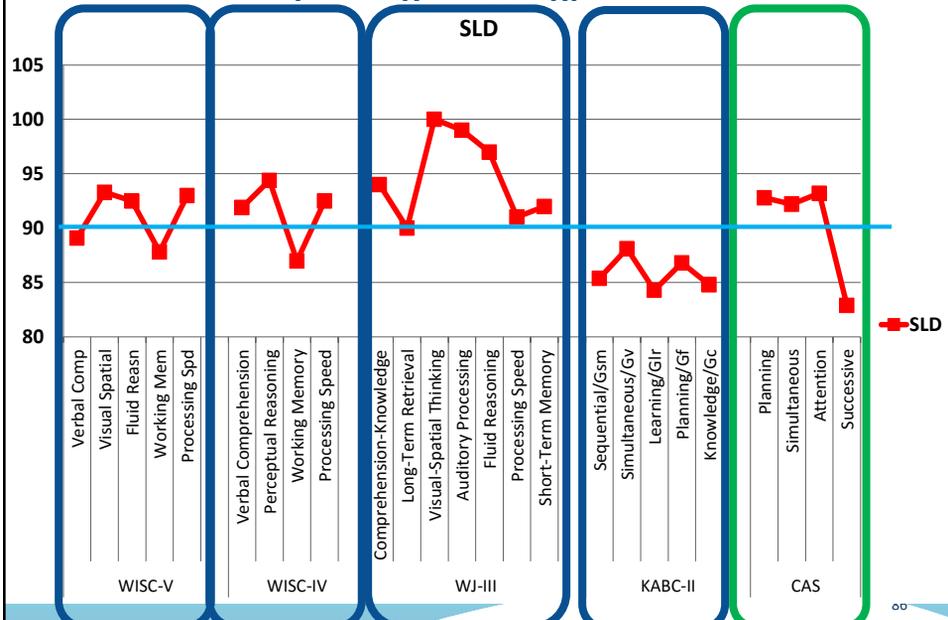

GROUP PROFILES BY ABILITY TEST

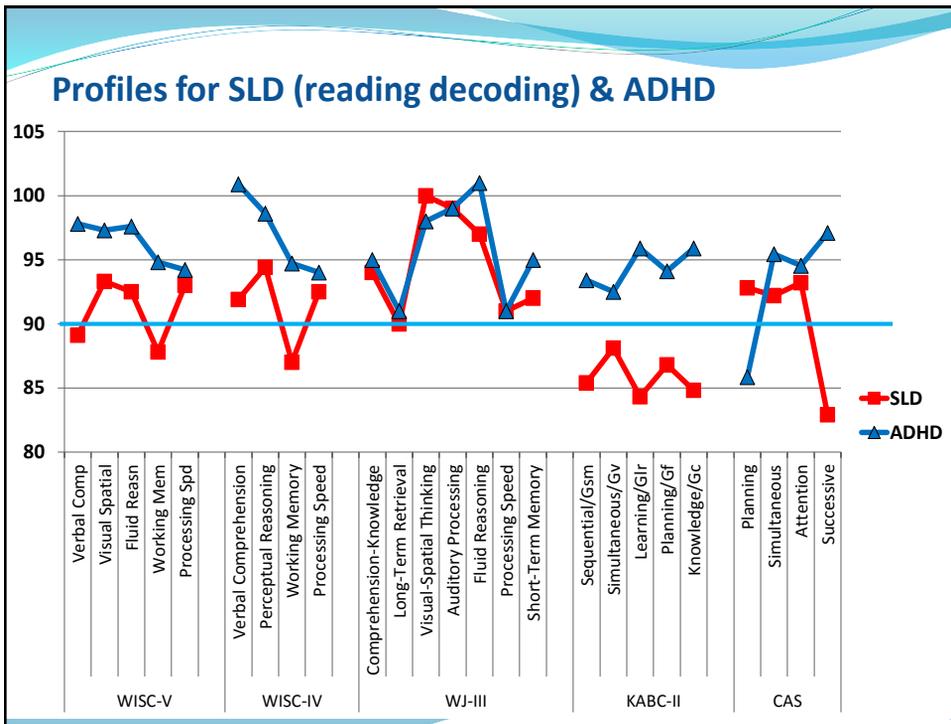

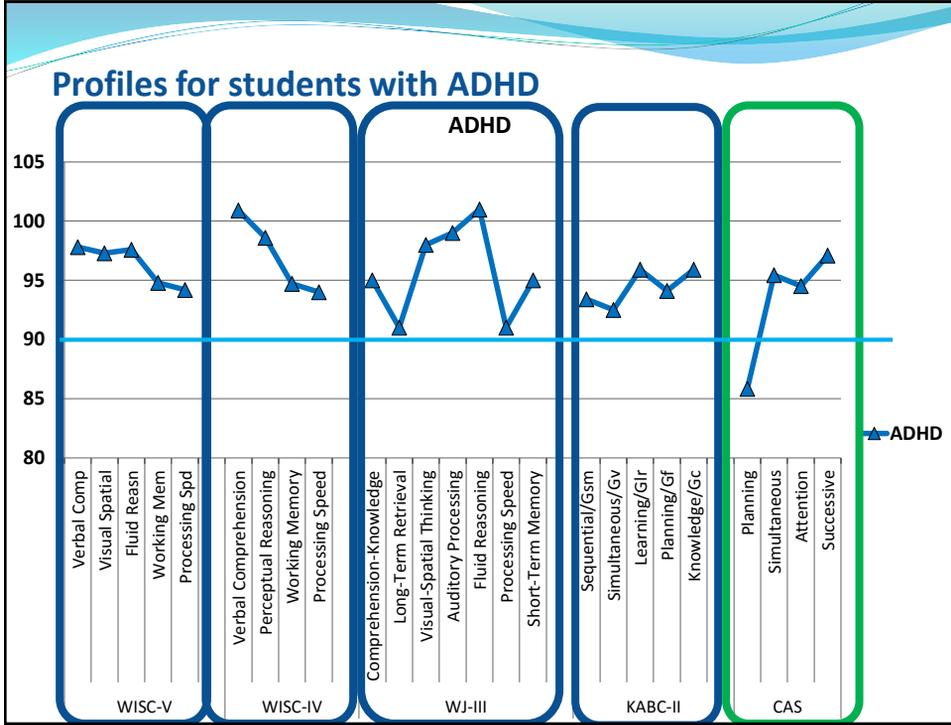

Because ability tests play such an important role in the diagnostic process, it is crucial to understand the sensitivity each test may have to any unique characteristics of those with an SLD or attention deficit. Clinicians need to know if an adolescent or adult has a specific deficit in ability that is related to a specific academic learning problem. There has been considerable research on, for example, Wechsler subtest profile analysis, and most researchers conclude that no profile has diagnostic utility for individuals with SLD or ADHD (Kavale & Forness, 1995). The failure of subtest profiles has led some to argue (e.g., Naglieri, 1999) that scale, rather than subtest, variability should

1. We need to know if intelligence tests yield distinctive profiles

2. Subtest profile analysis is UNSUPPORTED so use scale profiles instead

Profiles for SLD (reading decoding)

PASS Profiles and Educational Placement

Students receiving special education were more than four times as likely to have at least one PASS weakness and a comparable academic weakness than those in regular education

School Psychology Quarterly, Vol. 15, No. 4, 2000, pp. 419-433

Can Profile Analysis of Ability Test Scores Work? An Illustration using the PASS Theory and CAS with an Unselected Cohort

Jack A. Naglieri
George Mason University

A new approach to ipsative, or intraindividual, analysis of children's profiles on a test of ability was studied. The Planning, Attention, Simultaneous, and Successive (PASS) processes measured by the Cognitive Assessment System were used to illustrate how profile analysis could be accomplished. Three methods were used to examine the PASS profiles for a nationally representative sample of 1,597 children from ages 5 through 17 years. This sample included children in both regular ($n = 1,453$) and special ($n = 144$) educational settings. Children with significant ipsatized PASS scores, called Relative

89

SLD Profiles on CAS

Identifying Students With Learning Disabilities: Composite Profile Analysis Using the Cognitive Assessment System

Leesa V. Huang¹, Achilles N. Bardos²,
and Rik Carl D'Amato³

Abstract

The detection of cognitive patterns in children with learning disabilities (LD) has been a priority in the identification process. Subtest profile analysis from traditional cognitive assessment has drawn sharp criticism for inaccurate identification and weak connections to educational planning. Therefore, the purpose of this study is to use a new generation of cognitive tests with megacluster analysis to augment diagnosis and the instructional process. The Cognitive Assessment System uses a contemporary theoretical model in which composite scores, instead of subtest scores, are used for profile analysis. Ten core profiles from a regular education sample ($N = 1,692$) and 12 profiles from a sample of students with LD ($N = 367$) were found. The majority of the LD profiles were unique compared with profiles obtained from the general education sample. The implications of this study substantiate the usefulness of profile analysis on composite scores as a critical element in LD determination.

DISCRIMINANT VALIDITY OF THE COGNITIVE ASSESSMENT SYSTEM FOR STUDENTS WITH WRITTEN EXPRESSION DISABILITIES

Judy A. Johnson
University of Houston - Victoria
Achilles N. Bardos
University of Northern Colorado
Kandi A. Tayebi
Sam Houston State University

This study explored the PASS cognitive processing theory in junior high students (aged 11-15 years) with and without written expression disabilities. Ninety-six students with ($n = 48$) and without ($n = 48$) written expression disabilities were administered the Das-Naglieri Cognitive Assessment System (DN-CAS; 1997) and the writing subtests of the Wechsler Individual Achievement Test (WIAT; 1992). Discriminant analyses were utilized to identify

the DN-CAS subtests and composites that contributed to group differentiation. The Planning composite was found to be the most significant contributor among the four composite scores. Subsequent efficiency of classification analyses provided strong support for the validity of the obtained discriminant functions in that the four DN-CAS composite scale scores correctly identified 83% of the students as members of their respective groups.

The Das-Naglieri Cognitive Assessment System (CAS; Naglieri & Das, 1997) is a test of cognitive abilities or intelligence based on the Planning, Attention, Simultaneous, and Successive Theory (PASS; Das, Naglieri, & Kirby, 1994). Studies of CAS performance by children with attention deficit hyperactivity disorder (ADHD) generally show lowest performance on Planning, deficits in Attention, but normal Simultaneous and Successive processing (Crawford, 2002; Naglieri & Das, 1997; Naglieri, Goldstein, Jettara, & Schwabach, 2003; Naglieri, Saher, & Edwards, 2004; Paulino, 1999; Pontinger, 2002; Van Laet, Krosberg, & Naglieri, 2005). To date no studies have been conducted on group differences studies are important for validity and are necessary but not sufficient for establishing diagnostic utility of a test. The present study examined both distinct group differences and diagnostic utility of the CAS related to ADHD and found support for both.

The Das-Naglieri Cognitive Assessment System (CAS; Naglieri & Das, 1997) is a test of cognitive abilities or intelligence based on the Planning, Attention, Simultaneous, and Successive Theory (PASS; Das, Naglieri, & Kirby, 1994) which itself is based on Luria's Functional System of neuropsychology (Luria, 1966; Luria, 1973). PASS theory (Das, Naglieri, & Kirby, 1994; Naglieri & Das, 1997) proposes that children with attention deficit hyperactivity disorder (ADHD) would, as Barkley (2003, 2006) suggests, be more impulsive (and less reflective) in their cognitive processing, which in turn would impact planning processing. Attentional difficulties would affect attention processing. Studies of CAS performance of children with ADHD typically show lowest performance on Planning with deficits in Attention but normal Simultaneous and Successive processing (Crawford, 2002; Naglieri & Das, 1997; Naglieri, Goldstein, Jettara, & Schwabach, 2003; Naglieri, Saher, & Edwards, 2004; Paulino, 1999; Pontinger, 2002; Van Laet, Krosberg, & Naglieri, 2005). While these group differences studies provide support for the construct validity of the CAS via distinct group differences, such support is inadequate for determining the utility of the CAS in individual diagnostic

Specificity = .85, Negative Predictive Power = .88). While a number of CAS studies regarding students with ADHD have examined distinct group differences and found support (Crawford, 2002; Naglieri & Das, 1997; Naglieri, Goldstein, Jettara, & Schwabach, 2003; Naglieri, Saher, & Edwards, 2004; Paulino, 1999; Pontinger, 2002; Van Laet, Krosberg, & Naglieri, 2005), to date no studies have been conducted on the diagnostic utility of the CAS in correctly identifying individual children with ADHD from those without ADHD or from those with other disruptive behavior disorders. The present study examined the construct validity of the CAS by examining distinct group differences and the diagnostic utility of CAS in correctly differentiating individuals with ADHD symptoms from those within a normal control group.

Method

Participants
Informed parental consent was obtained for a final sample of 40 students from elementary schools in suburban Pierce County, Washington, ranging from kindergarten to second grade. Groups consisted of children meeting diagnostic criteria for ADHD ($n = 20$) and a group of children who were randomly selected and matched (to the extent possible) on key

Georgiou & Das (2013)

Article

University Students With Poor Reading Comprehension: The Hidden Cognitive Processing Deficit

George K. Georgiou, PhD¹ and J. P. Das, PhD¹

Abstract

The present study aimed to examine the nature of the working memory and general cognitive ability deficits experienced by university students with a specific reading comprehension deficit. A total of 32 university students with poor reading comprehension but average word-reading skills and 60 age-matched controls with no comprehension difficulties participated in the study. The participants were assessed on three verbal working memory tasks that varied in terms of their processing demands and on the *Das-Naglieri Cognitive Assessment System*, which was used to operationalize intelligence. The results indicated first that the differences between poor and skilled comprehenders on working memory were amplified as the processing demands of the tasks increased. In addition, although poor comprehenders as a group had average intelligence, they experienced significant difficulties in simultaneous and successive processing. Considering that working memory and general cognitive ability are highly correlated processes, these findings suggest that the observed differences between poor and skilled comprehenders are likely a result of a deficient information processing system.

93

IQ Correlations with Achievement?

- IQ scores correlate about **.5 to .55** with achievement Intelligence (Brody, 1992)
- But traditional tests have achievement in them
- Naglieri (1999) summarized the correlations between several tests and achievement
 - The median correlation between each test's overall score and all achievement variables was obtained

94

Ability & Achievement (Naglieri, 1999)

	Tests with knowledge			Tests with Little knowledge	
	WISC-III FSIQ	DAS GCA	WJ-R Cog	K-ABC MPC	CAS FS
Median r	.590	.600	.625	.630	.700
N	1,284	2,400	888	2,636	1,600

WISC-3: WIAT Manual Table C.1 ages 6-16; WJ-R Technical Manual; CAS Interpretive Handbook; K-ABC Interpretive Manual; DAS Handbook. Increase = $(r^2_1 - r^2_2) / r^2_1$ where r^2_1 = WISC-3 WIAT correlation

Conclusion: YOU DON'T need Verbal and Quantitative to correlate with achievement

95

Correlations with Achievement

- Next, a summary of ability test correlations with achievement EXCLUDING the scales that clearly require knowledge
- The average correlations of the SCALES with achievement and those without achievement were obtained to avoid ***criterion contamination...***

96

Correlations with Achievement

- Average correlations between IQ Scales with total achievement scores
- The strength of measuring *basic psychological processes* as PASS is clear

Note: All correlations are reported in the ability tests' manuals. Values per scale were averaged within each ability test using Fisher z transformations.

Note: WJ-IV Scales Comp-Know= Vocabulary and General Information; Fluid Reasoning = Number Series and Concept Formation; Auditory Processing = Phonological processing.

Time to Reflect

Implications

- Non-discriminatory data suggest that traditional IQ tests yield larger race and ethnic differences than tests of basic psychological processing.
 - Conclusion: KABC2 and CAS2
- Validity data suggests show not all tests yield profiles that differentiate SLD and ADHD, evidence needed for determining strengths and weaknesses suggests.
 - Conclusion: CAS2 yields different profiles
 - And CAS correlates the highest with achievement.

The Case of Rocky – Discrepancy Consistency Model example

From assessment to intervention

The case of Rocky

- ▶ Rocky¹ is a real child with a real problem
- ▶ He lives in a large middle class school district
 - a wide variety of services are available
- ▶ In first grade Rocky was performing significantly below grade benchmarks in reading, math, and writing.
 - He received group reading instruction weekly and six months of individual reading instruction from a reading specialist
 - He made little progress and was retained

Note: This child's name and other potentially revealing data have been changed to protect his identity.

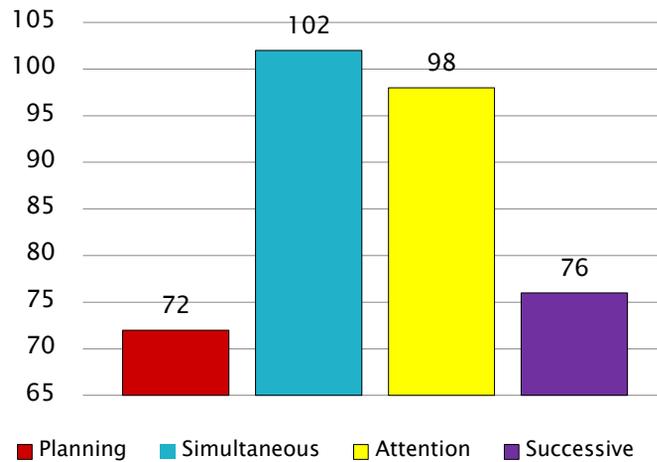

101

The case of Rocky

- ▶ By the middle of his second year in first grade Rocky was having difficulty with
 - decoding, phonics, and sight word vocabulary; math problems, addition, fact families, and problem solving activities;
 - and focusing and paying attention.”
- After two years of special team meetings and special reading instruction he is now working two grade levels below his peers and is having difficulty in reading, writing, and math
- A comprehensive evaluation was conducted
- Here is a look at just the evidence of a ‘disorder in basic psychological processes’

102

Basic Psychological Processing Scores

103

The case of Rocky

- ▶ He has intra-individual differences in cognitive processes that underlie his academic problems
- ▶ Rocky has a “disorder in one or more of the basic psychological processes”

	Score	Diff	Significant	S/W
Planning	72	-15.0	yes	Weakness
Simultaneous	102	15.0	yes	
Attention	98	11.0	yes	
Successive	76	-11.0	yes	Weakness
PASS mean	87.0			

104

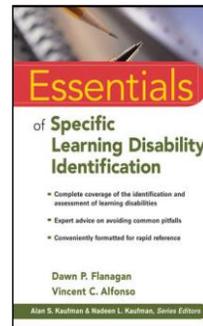

Discrepancy / Consistency Model

- The Discrepancy / Consistency model is a conceptual framework that was first introduced in 1999
- Similar models have been proposed by Hale and Flanagan

1999

THE DISCREPANCY/CONSISTENCY APPROACH TO SLD IDENTIFICATION USING THE PASS THEORY

Jack A. Naglieri

There are many reasons why children experience academic failure (e.g., poor instruction, lack of motivation, visual or auditory problems, lack of exposure to books and reading, instruction that does not meet a child's particular style of learning, overall limited intellectual ability, a specific intellectual ability deficit, etc.). This chapter focuses on those children who have a disorder in one or more of the basic psychological processes that underlie academic success and failure; that is, children with scores on a reliable and well-validated multidimensional test of cognitive processes that vary from the average to the well below-average ranges, with corresponding variability in standardized achievement test scores. These children can only be identified via a comprehensive assessment using nationally normed tests that uncover the processing deficit(s) and associated academic failure, despite adequate instruction and a consideration of other exclusionary factors. These types of children would meet the criteria for a specific learning disability (SLD) as defined by the 2004 reauthorization of the Individuals with Disabilities Education Improvement Act (IDEA; see Hale, Kaufman, Naglieri, & Kavale, 2006).

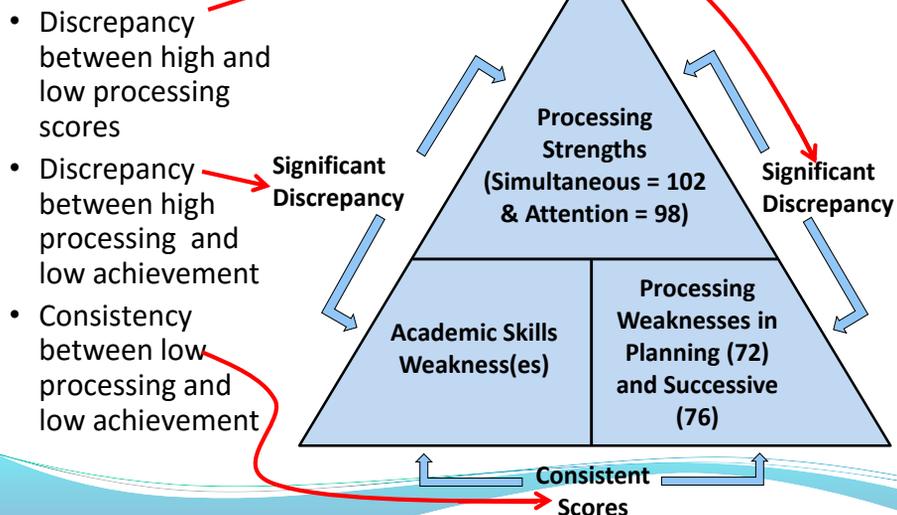

This chapter is about children who have a disorder in one or more of the basic psychological processes. These children's academic failure may be exacerbated by poor instruction, but inadequate teaching did not cause the problem. These children would likely benefit from frequent progress monitoring, but ongoing progress monitoring is not enough to ensure academic success. In order to understand the reasons for academic failure, these children need to be carefully

Discrepancy / Consistency Model

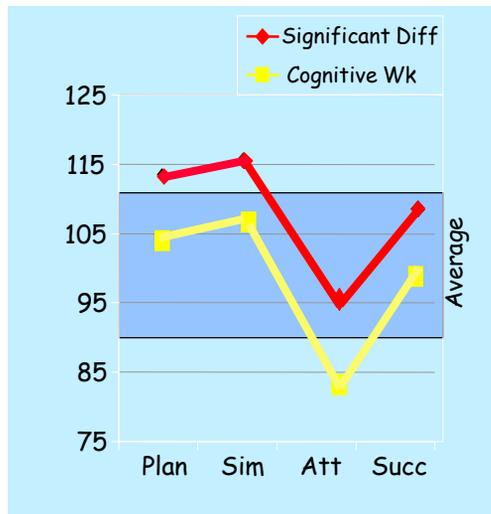

- The Discrepancy / Consistency Model is a method used to ensure that there is evidence of “a disorder in 1 or more of the basic psychological processes ... which manifests itself in the imperfect ability to listen, think, speak, read, write, spell, or do mathematical calculations.”
- The disorder in 1 or more basic psychological processes is found when a student shows a pattern of strengths and weaknesses in basic psychological processes, **and...**
- The imperfect ability to listen, think, speak, read, write, spell, or do mathematical calculations is found when a student shows a pattern of strengths and weaknesses in achievement
- The result is two discrepancies and a consistency

107

Discrepancy Consistency Model for SLD

Evidence of a 'disorder in processing'

▶ Significant Difference

- Is low relative to the child's mean score

▶ Cognitive Weakness

- Is a Significant weakness and the score falls below the Average range (<90)

109

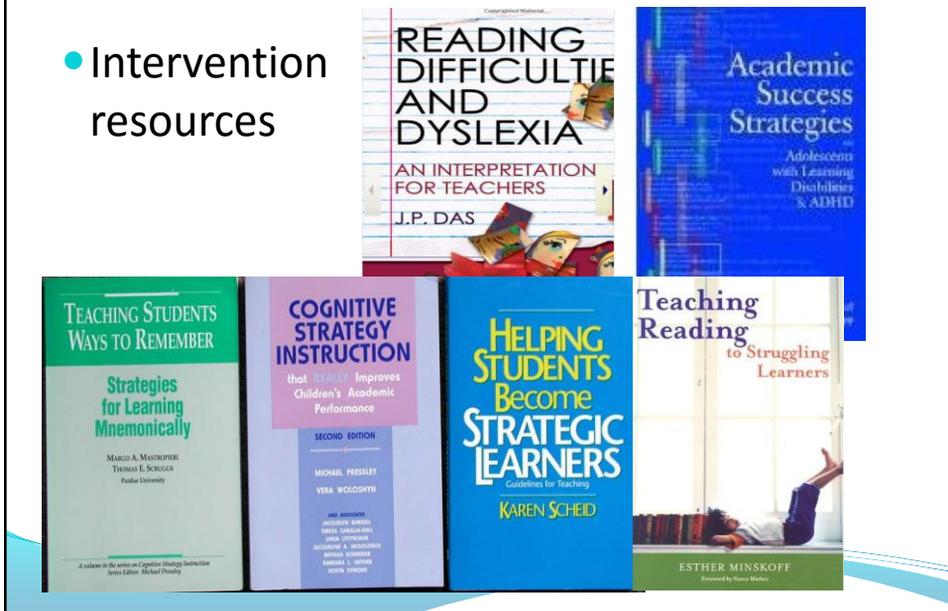

The case of Rocky

- ▶ Rocky meets the definition of SLD in IDEA
 - He requires specialized intervention that takes into account his learning needs
 - Intervention should emphasize the use of strategies and plans in all content areas
 - Intervention should include ways to better work with serial information
 - Rote memory and phonics instruction are ill-advised

Interventions for Rocky

Using Plans to Overcome Anxiety

Graphic Organizers for
Connecting and Remembering Information

Remembering and relating information is a common part of learning and daily life. Students are

Segmenting Words for
Reading/Decoding and Spelling

Decoding a written word requires the person to make sense out of printed letters and words and

Chunking for Reading/Decoding

Reading/decoding requires the student to look at the sequence of the letters in words and understand the organization of specific sounds in order. Some students have difficulty with long sequences of letters and may benefit from instruction that helps them break the word into smaller, more manageable units, called *chunks*. Sometimes the order of the sounds in a word is more

A Cognitive Strategy Instruction to Improve Math Calculation for Children With ADHD and LD: A Randomized Controlled Study

Jackie S. Iseman¹ and Jack A. Naglieri¹

Abstract

The authors examined the effectiveness of cognitive strategy instruction (Successive) given by special education teachers to students with ADHD. The experimental group were exposed to a brief cognitive strategy instruction for development and application of effective planning for mathematical computation. Standardized tests of cognitive processes and math skills (Wechsler Intelligence Scale, Johnson Tests of Achievement, Third Edition, Math Fluency and Wechsler Numerical Operations) were administered pre- and postintervention, and at 1 year follow-up. Large pre–post effect sizes were found for students in the experimental group (0.85 and 0.26), Math Fluency (1.17 and 0.09), and Numerical Operations (0.85 and 0.26). At 1 year follow-up, the experimental group continued to outperform the comparison group. Students with ADHD evidenced greater improvement in math worksheets (which measured the skill of generalizing learned strategies to other situations) when provided the PASS-based cognitive strategy instruction.

119

One Year Follow-up

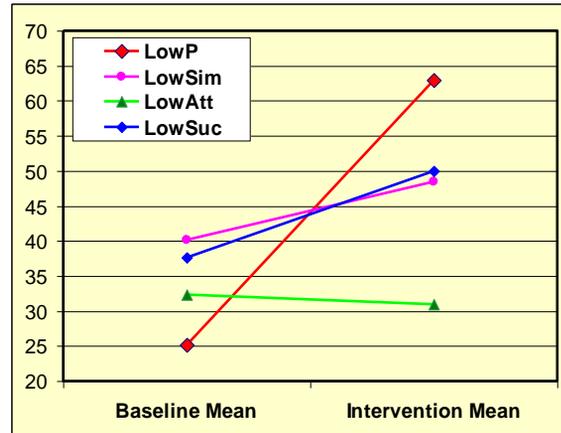

At 1-year follow-up, 27 of the students were retested on the WJ-III ACH Math Fluency subtest as part of the school's typical yearly evaluation of students. This group included 14 students from the comparison group and 13 students from the experimental group. The results indicated that the improvement of students in the experimental group ($M = 16.08$, $SD = 19$, $d = 0.85$) was significantly greater than the improvement of students in the comparison group ($M = 3.21$, $SD = 18.21$, $d = 0.09$).

jnaglieri@gmail.com www.jacknaglieri.com

120

Iseman (2005)

- Baseline Intervention means by PASS profile
- Different response to the same intervention

Cognition (Planning scores) predicted response to intervention

Conclusions

- When we measure PASS basic neurocognitive processes with the CAS2 we ...
 - measure abilities from a brain-based theory
 - can assess students fairly
 - obtain profiles for special populations
 - can select interventions that match the PASS characteristics of the learner
