

Assembly Instructions

LEGACY MODE

Adding Legacy mode adaptor to the headset.

1. Installation of Legacy mode:

Legacy mode (g) is a maker project which gives you access to the backfacing camera and much of the world of camera based AR.

We have tried to make the installation as simple as possible, but you will need a few things not in the kit.

First fold the wings of the Legacy part inward. We will attach the black side inwards.

2. Cutting and setup: Identify the dashed line on the front of the headset- it corresponds with the mirror inside. Using an box cutter carefull cut around the mirror. Following the dashed lines and making multiple passes will make for a clean cut.

3. Rotating the mirror:

It might be good to have the headset disassembled to rotate the mirror. The top half of the mirror is not attached. This will allow you rotate or fold up the mirror. Pull the bottom edge up adn keep constant pressure around the pivot point. You might gently score the pivot line with a ruler to ensure a clean rotation.

The mirror will rotate up to a 45° angle and wedge against the phone holder base.

4. **Fitting** : Now dry fit the part onto the headset before using the velcro to fix it in place. Use the black foam blank to replace where the phone normally sits and prepare to mount the phone up front. Make sure all fasteners are secure before proceeding.

- 3 **Installing the phone**: Peel back the nylon band and insert the phone with screen facing in toward the mirror. Close the nylon band.

Affix the headband load some content and have fun.
