

Stereo Lens

Getting the best viewing with stereo lenses

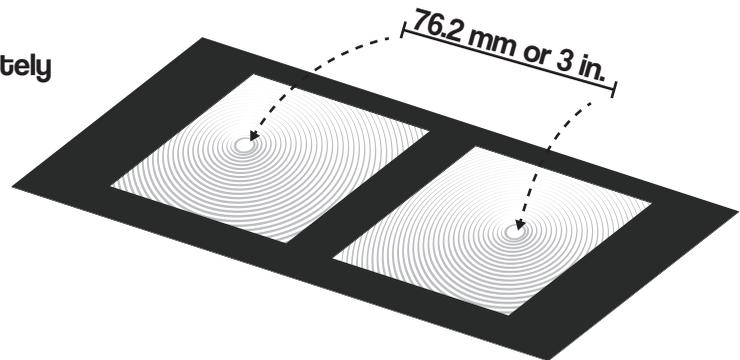

Without going to manufacture of fixed lenses, we have included a stereo pair that is attached with transparent tape.

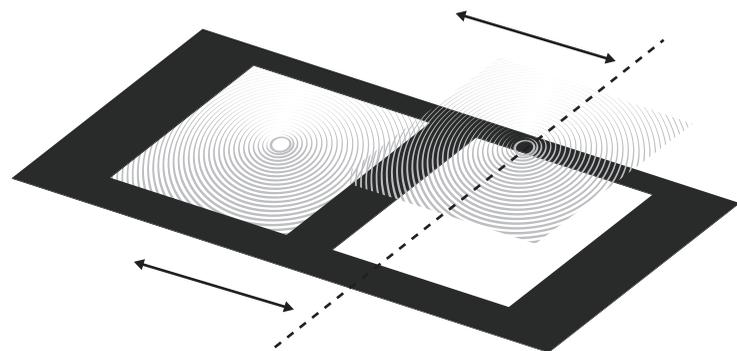

It's best to keep the lens smooth side down when loaded in the headset.

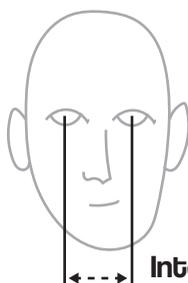

The optical center of these lenses are approximately 3 inches apart. Most viewers will find satisfactory 3D with this arrangement.

Carefully cut the transparent tape and reposition the optical center. A simple shift in or out a few mm will be enough to accommodate your interocular distance.

Be sure to adjust both lenses.

Interocular distance is measured here between your pupils.
