

xOps helps organizations run their technology more effectively and more efficiently.

DEVOPS CONSULTING

xOps drives DevOps implementation with our management consulting and talented engineers. At xOps we specialize in DevOps transformation.

Providing DevOps Leadership and Teams

DevOps Starts with Leadership

Where does the leader start? Does he start with picking the right people who are more collaborative in mind-set or pick engineers who understand how to use collaborative tools? xOps delivers both.

Our DevOps thought leaders get buy it from organizational stakeholders driving transformation from the top down and bottom up simultaneously. We start working with individual teams to quickly show the value of what DevOps brings to the organization. We work closely with our clients to bring the right resources to help spur your transformation. We believe that good DevOps resources are great developers and great operators but, more than anything, they are great collaborators

Designing the Organizational Model

It takes more than a DevOps engineer to make a DevOps organization. DevOps is a cultural shift. It is a deeper understanding of what it takes to build and run applications and services and building empathy across all teams. DevOps is about breaking down silos and building an organization that meets market demands.

xOps provides team leaders, architects, and engineers. We can help organize those teams, help to decide when to expand the team, and how to make changes on what people are doing and maybe broaden or narrow their roles. Helping you meet your business needs is our primary objective.

Recruiting and Managing People

DevOps is no longer an infrastructure guy that wants to do development, or a development guy that wants to do infrastructure. We find that most effective DevOps engineers understand both. More than anything our engineers bring a keen focus on the customer.

OPEN SOURCE TOOLS

xOps is developing a suite of open source tools to help operations run seamlessly. Our cornerstone product, xView, provides data correlation and presentation to help customers analyze data from multiple sources in one place. xView takes data from any source, from system level information to business metrics, to provide a holistic picture of how your systems are working

DEVOPS MANAGED SERVICES

We provide onsite and offshore managed services. Our DevOps Managed Services are the best because we put senior engineers on the front line. Our front line engineers help automate fixes and develop self-healing systems. We apply machine learning to help anticipate and prevent downtime and outages.

Picking the Right Tech and Tools

If the tools don't satisfy what it is they're trying to do, as opposed to going off and doing their own thing, we bring that feedback back to the release engineering function/ We then have them build a tool, and collaborate, for them to have the tools available to satisfy the challenges they're running into. Once we've created a tool-set, and we've deployed and gotten adoption, we want to have a DevOps engineer married to the program, and they own it for the entire lifecycle of that product.

The right tools and automation help your engineers work more efficiently driving down the cost of operations. We want to give teams all the dashboards and automation they need. Coupled with an understanding of what's important, and what's noise, they can effectively bring high reliability to the product. DevOps as a culture ties it all nicely together allowing the organization to scale using the self-service tools. The individual functions come together and provide a more holistic solution.

Breaking Barriers, Building Bridges

With DevOps, it's about breaking barriers, and bridging engineering with operations. We want the DevOps engineer to have ownership, not just of the features they're releasing, but how it performs in production, and that ownership and accountability is key to what we do.

The leader needs to not only communicate with the team but have the sense of ownership. If something is constantly going down, it's on them to make their lives easier, make engineering's life easier, and address those problems. xOps focuses on tight feedback loops from product back into the engineering to deliver more value to the customer more rapidly.

Building and Measuring the Process

As more enterprise companies are taking on the challenge of DevOps, the need for standard measurements has become more evident. Over the years of working with companies of all sizes we have helped to understand and define measurement techniques which focus, not just on the DevOps methodologies, but also on the results. Our methods have been applied to companies in size of upwards of \$7B with over 50,000 employees.

Determine what results you need to drive in your company and let us help you measure success.
