It appears you're asking about the amount of asphalt roads resurfaced annually in Spokane, Washington. Here's a breakdown of what the search results indicate:

- Spokane County:
 - Spokane County overlays approximately one to two miles of road per year as part of their asphalt overlay program, which is a preservation method for urban arterials.
- City of Spokane:
 - The City of Spokane uses a "grind and overlay" method where they mill out 2-4 inches of asphalt and install a new layer. This is done on about 10 lane miles per year.
- Spokane River Centennial Trail:
 - In 2024, a 14-mile section of the Spokane River Centennial Trail was resurfaced with a new asphalt layer. This was a major project to address wear and tear and improve the trail's condition. Another 11-mile section is proposed for resurfacing in the future, pending funding. However, this is a one time project and not an annual resurfacing effort.

Important Notes:

- Lane Miles vs. Miles: It's important to distinguish between "lane miles" and "miles." Lane miles refer to the length of a road multiplied by the number of lanes. For example, a one-mile stretch of a four-lane road would equal four lane miles.
- Different Entities: The City of Spokane and Spokane County are separate entities, each responsible for maintaining different roads within the region. So, the resurfacing figures mentioned refer to different road networks.
- Variations in Resurfacing: The type of resurfacing can vary. It can involve just overlaying new asphalt, like on the Centennial Trail, or it can involve grinding down the old asphalt and then overlaying, as the City of Spokane does.

Spokane County resurfaces about one to two miles of asphalt roads, and the City of Spokane resurfaces roughly 10 lane miles each year. These figures represent the most relevant information from the search results.
