

a guide to

Air

Changes

per Hour

Covid is airborne.
That's why it's
important to clean
indoor air using
purifiers.

"Air changes per hour" (ACH) is one way to measure the ventilation in a space. An ACH of 2, for example, means that the entire volume of air in a room is being changed every 30 minutes.

While ACH is usually achieved through the introduction of outside air, air purifiers can also achieve high ACH levels in a room! Think of them as scrubbing the indoor air.

Brand new air every 10 minutes (ACH 6) is the standard recommended for airborne pathogens. It is also the standard Clean Air Club strives for.
