Items Included in the kit

Wood Fixture 1X

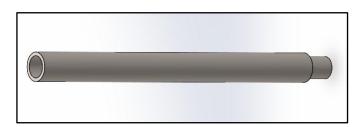

8oz Can with cap 4X

Silicone Plug 1X

Clear Mixing cup 4X

Steel Core Rod 1X

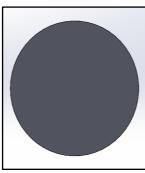

Head Assembled 4X

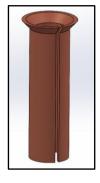

Head Nut 4X

Tube Nut 4X

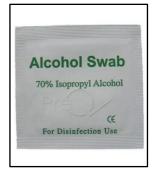

Vinyl Sticker 4X

Copper Tube 4X

1g Super Glue 4X

Alcohol Swabs

Funnel 1X

Can Cap 1X

4X

PART 1

THE MIXTURE

Items you will need in this section

Pocket scale

Potassium Nitrate (Fireworks Grade)

Metal Spoon

Sugar

Non-Scented Candles

Clear Mixing cup

- Place a cup on the scale and hit tare. This will zero out the scale, so the measurement is accurate.
- Using the spoon, place **60 grams of potassium nitrate** into the cup. Do a little at a time to reach 60 grams. Set this cup aside.
- With a new cup on the scale, using the spoon, place
 40 grams of sugar into the cup. Do a little at a time to reach 40 grams. Set this cup aside
- Place a new cup on the scale. If you purchased solid candles, use a scissor or box cutter and chip away chunks of wax. Put **35 grams of wax** into the cup and set aside.

Try to stay within +/- .5 - .8 grams. Any extreme deviation from the above amounts will result in an undesired result.

1X mixture for M8 Mini 2X mixture for M8

PART 2

THE MIXING

Items you will need in this section

Coffee Grinde r

Single burner Cooktop

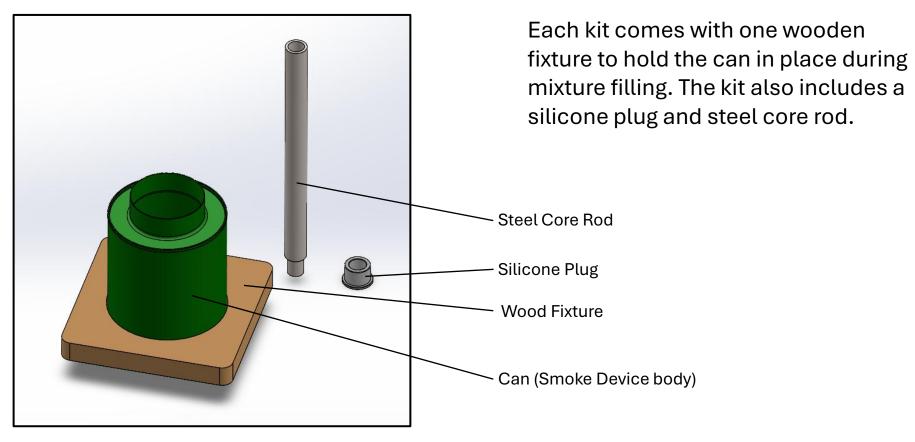

Small 5-6" pot

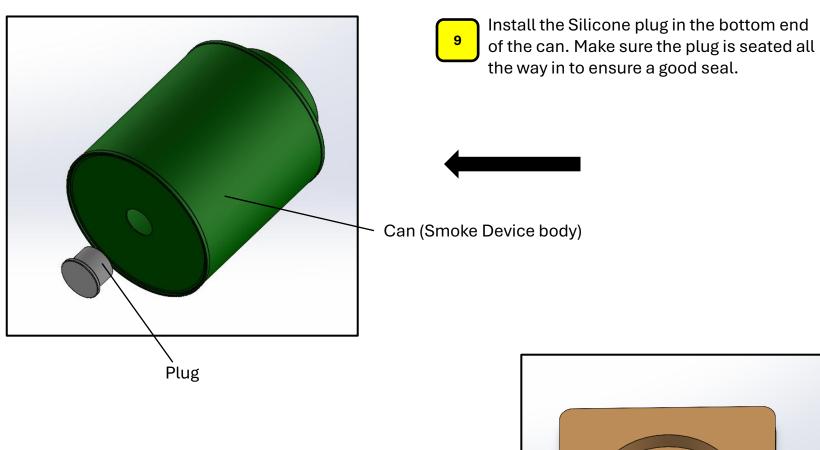

- Take your 60 grams of potassium nitrate and 40 grams of sugar and combine them in the coffee grinder. Mix for 1-2 minutes while tapping the sides, shaking it, turning it upside down, ensuring the mixture is even. These grinders are good, but a lot of the powder falls below the blade. When this is complete place the mixture into an empty cup and set aside.
- Plug in your cook top with the pot on the burner and set to the lowest setting. Dump your 35 grams of candle wax into the pot and melt. Stir with a metal spoon so all the chunks melt faster.
- When the wax is completely melted, dump your potassium nitrate and sugar mix into the wax. Using the metal spoon stir the mixture until the combined powder is fully coated. This mixture we **DO NOT** want to caramelize like other recipes so you may have to turn off your heat to prevent this. Stir until smooth.
 - Once the combined mixture of potassium nitrate and sugar is coated with melted wax, the mixture should form a slurry or a smooth wet paste. Turn your burner off and let sit while you prepare for pouring. Turn the burner on again to keep warm if you need to.

You will need to repeat this process twice to fill the 8oz can

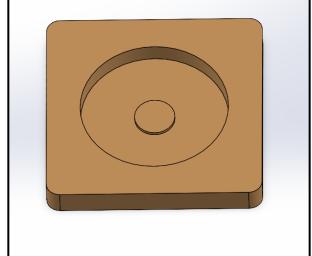

PART 3

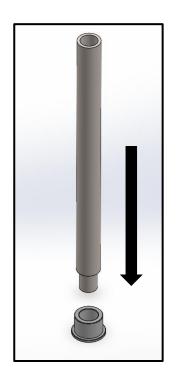

THE POUR

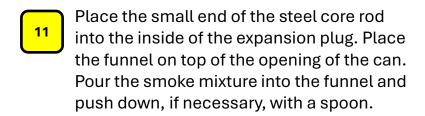

The wood fixture has a disc in the bottom for the silicone plug to rest on. Place the can into the fixture.

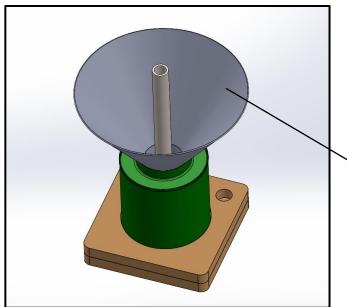

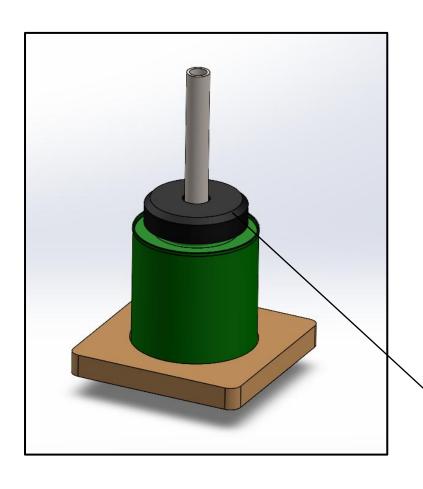

Remove the funnel.

Keeping the can held down flat, jog the fixture back and forth to get the hot mixture to level out.

Make new mixture of potassium nitrate, sugar and wax. Repeat steps 1-14.

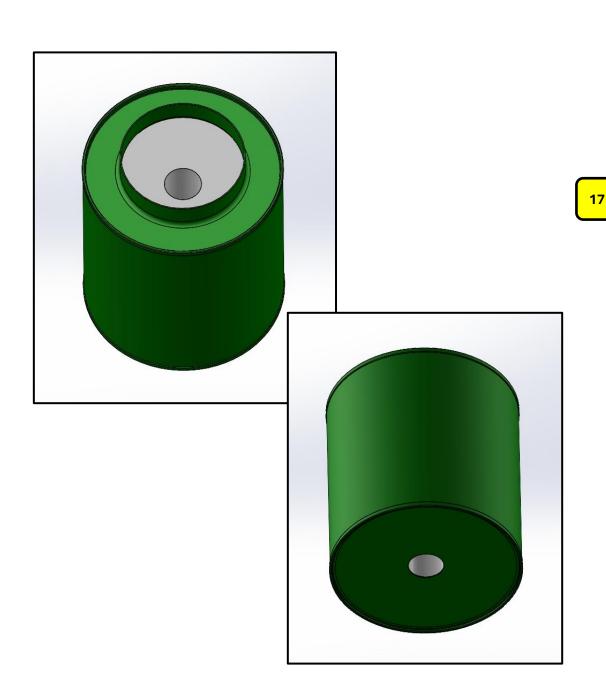

Funnel

- Install the plastic can cap with the steel core rod still inside. The cap will help keep the steel core rod centered.
- Place in freezer for 45min to 60min. Air cooling can be done but cooling times may vary.

Can Cap

When the mixture has completely cooled, remove the steel core rod, the expansion plug and can cap. If the steel core rod is stuck, use a heat gun and let the heat transfer from the top of the steel core rod down to the bottom. Do not aim the heat towards the mixture inside the can. Vise Grip plyers can be used but it will damage the metal. Do not put the damaged end inside the can when you make more.

Repeat the whole process for the other cans provided in the kit.

PART'4 FINALASSEMBLY

Watch this detailed video on how to attach the igniter to the M8 head.

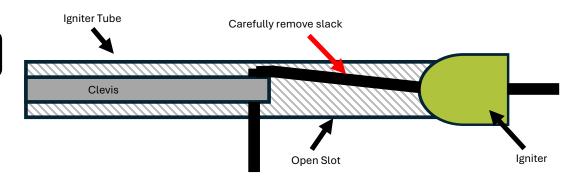

This method includes the M8 Instant Deployment and Spoon Version

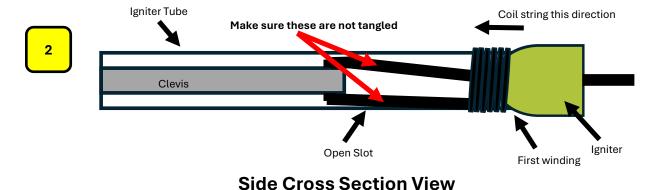

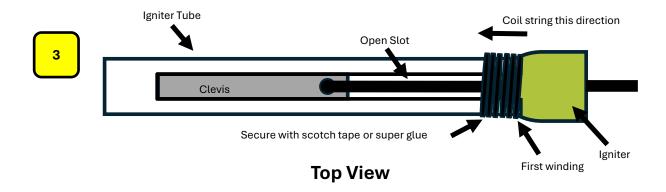

Setting the igniter to the M8 Head

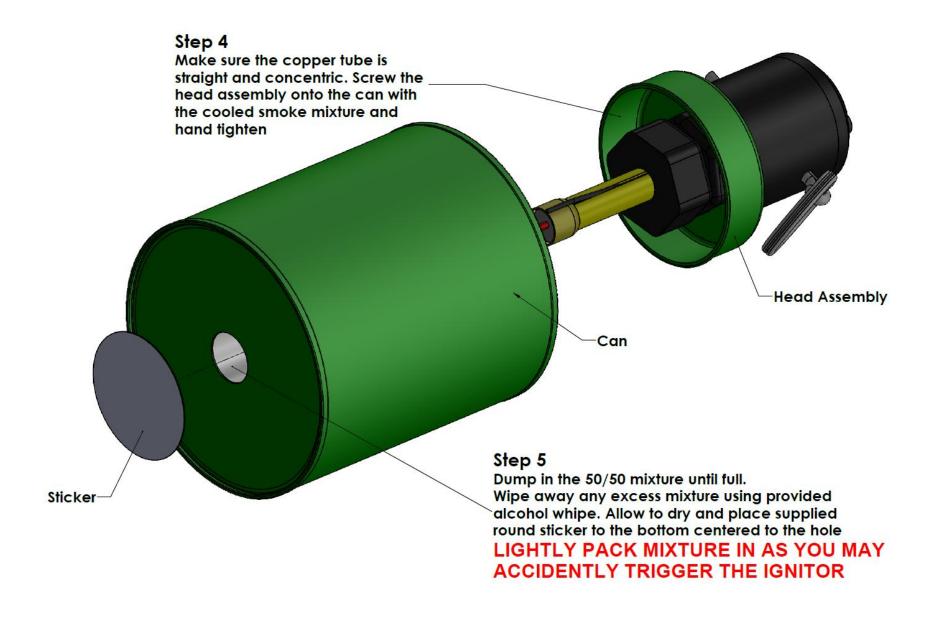

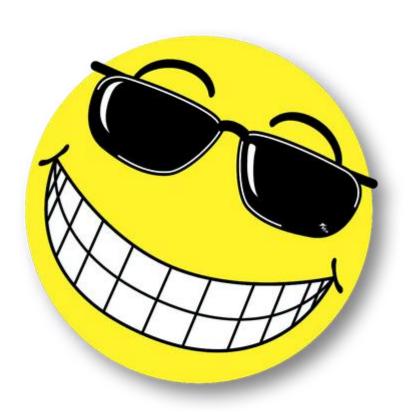

Side Cross Section View

Congratulations! You did it. You created your first smoke device.

Ok now calm down. Before you pull the pin, some safety needs to be considered.

- Always hold the smoke device with the bottom facing directly down.
- Never point it at anyone and do not have it on an angle towards yourself.
- Hold the smoke device with your arm extended with your dominant hand.
- Pull the keyring with your opposite hand.
- The ignition is instantaneous.
- Immediately throw the smoke device to a safe distance
- The reaction of the mixture is hot. Do not throw it any area that can catch fire, or you don't want burned.
- Wait 20 minutes before picking up spent smoke device
- Have fun!
