Ground Water (or if you prefer "Groundwater") and Wellfield Management

This is an introduction for the practical operations leader to groundwater occurrence, movement, and protection for groundwater-source systems, and also considering groundwater in watershed protection and management. We will look at how to

- locate wellfields and protect the ones you have
- maintain and enhance recharge
- avoid contamination of groundwater supplies
- account for natural water quality issues in daily operations
- operate wells sustainably

Ground Water Advantages as a Water Source

- Relatively – not absolutely – more protected from contamination, especially the potentially pathogenic
- Chemistry relatively stable – predictable and requiring less adjustment in treatment day-to-day
- Turbidity and microbial content usually much less than surface water
- Aquifers are bigger than constructed reservoirs by a long shot

Types of Aquifers in Ohio

Carbonate

Sandstone

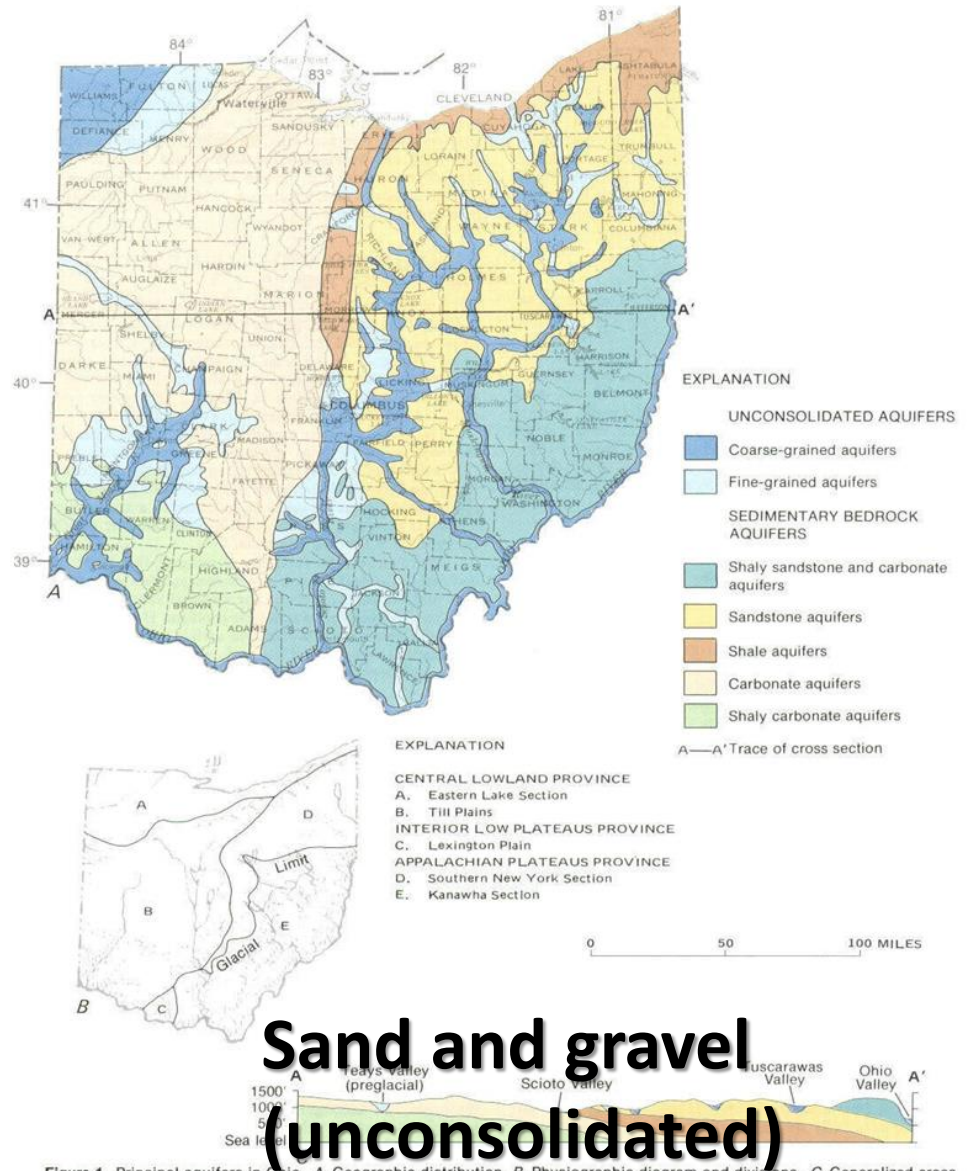

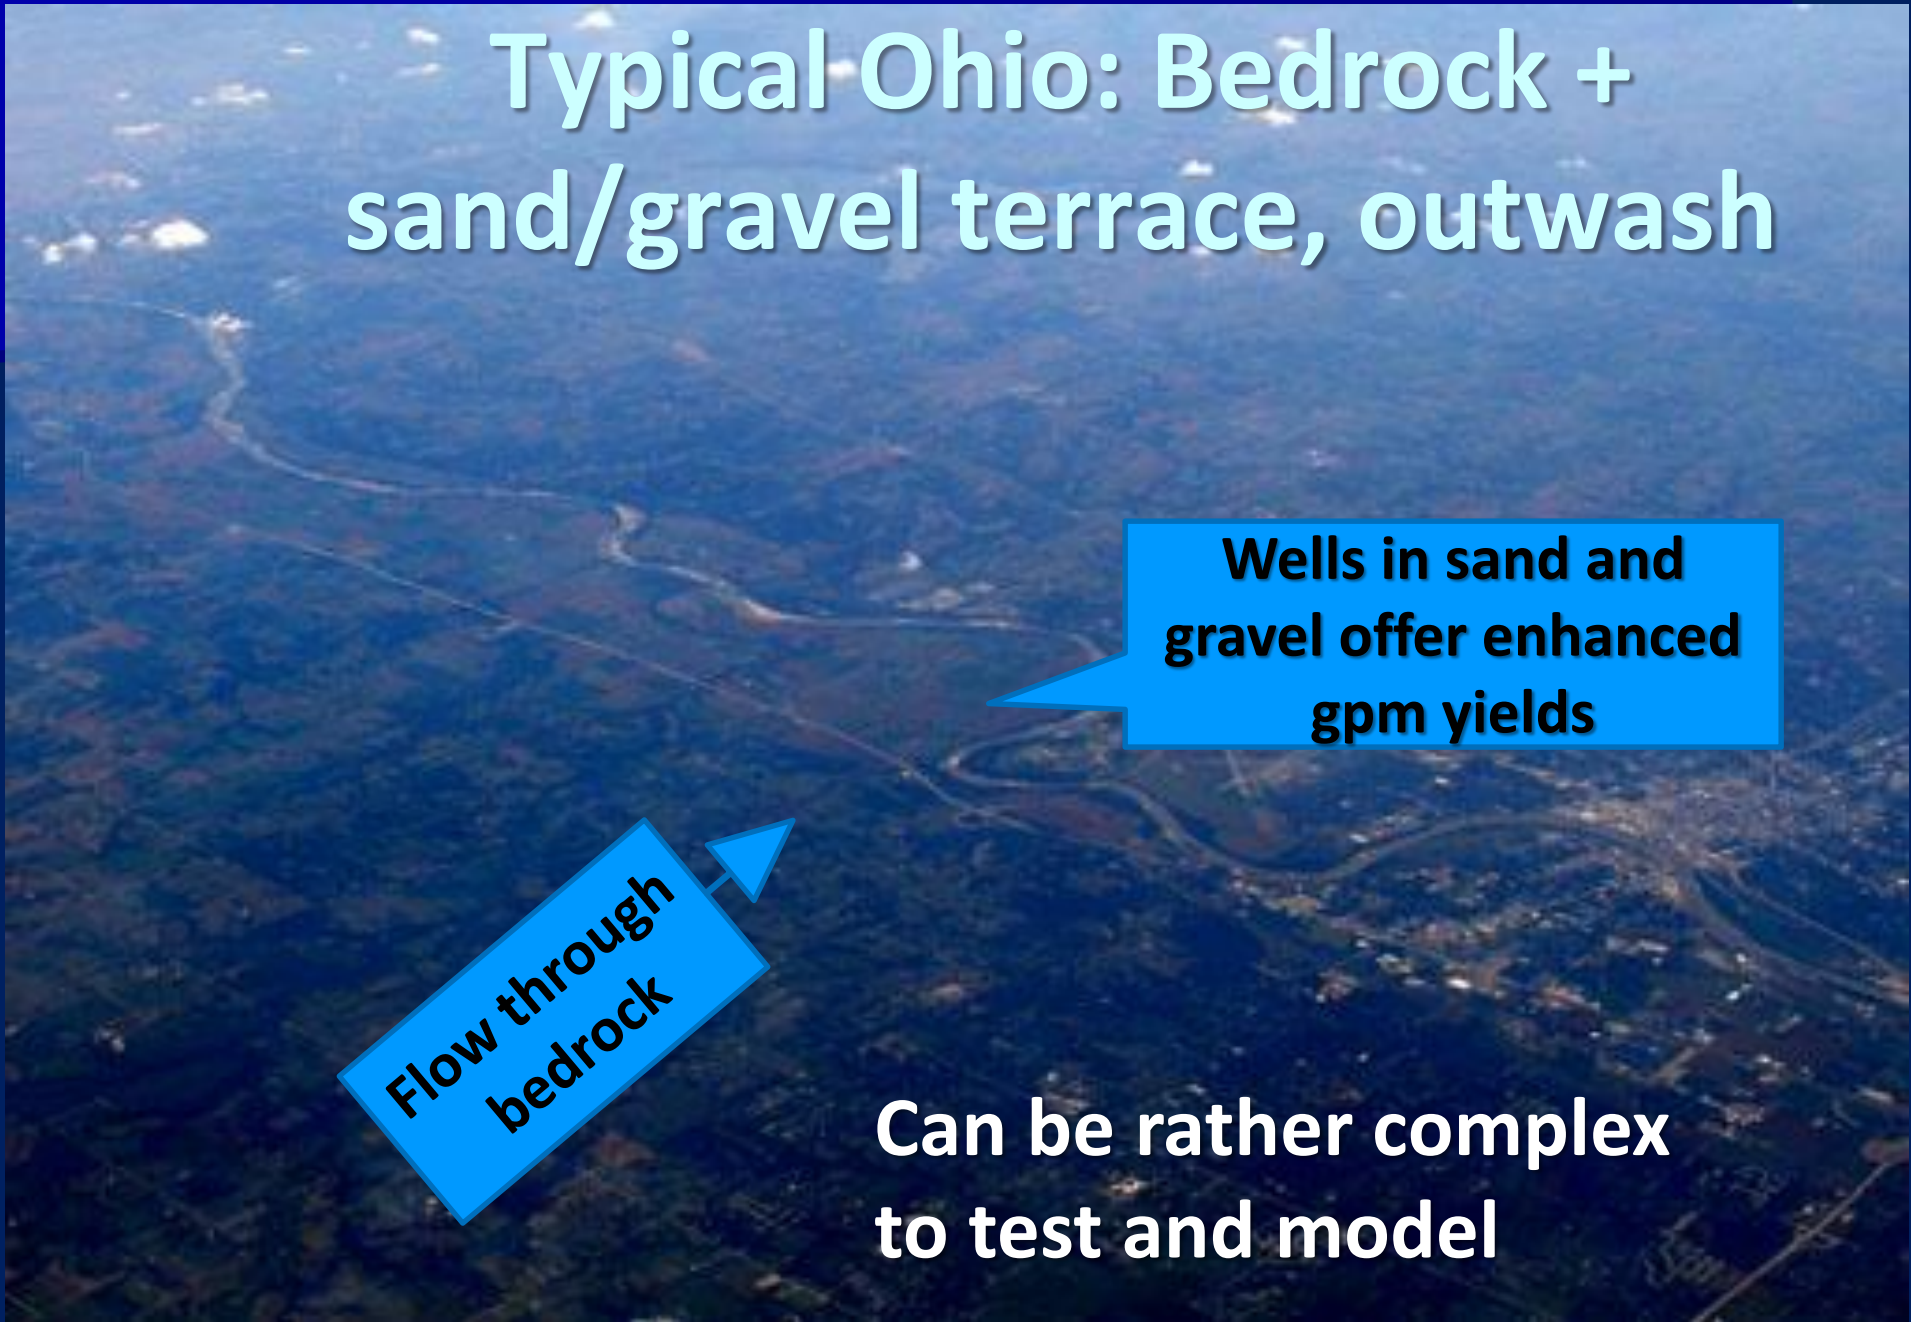

Figure 1. Principal aquifers in Ohio. A, Geographic distribution. B, Physiographic diagram and divisions. C, Generalized cross section (A-A'). (See table 2 for a more detailed description of the aquifers. Sources: A, Files of the Ohio Department of Natural Resources, Division of Water. B, Fenneman, 1938; Raisz, 1954. C, Files of the Ohio Department of Natural Resources, Division of Geological Survey.)

Typical Ohio: Bedrock + sand/gravel terrace, outwash

Wells in sand and gravel offer enhanced gpm yields

Flow through bedrock

Can be rather complex to test and model

Unconfined aquifer configuration: water level within aquifer

Confined aquifer configuration: Water level above top of aquifer

River valley multi-layer

High hydraulic-conductivity aquifer

Low hydraulic-conductivity confining unit

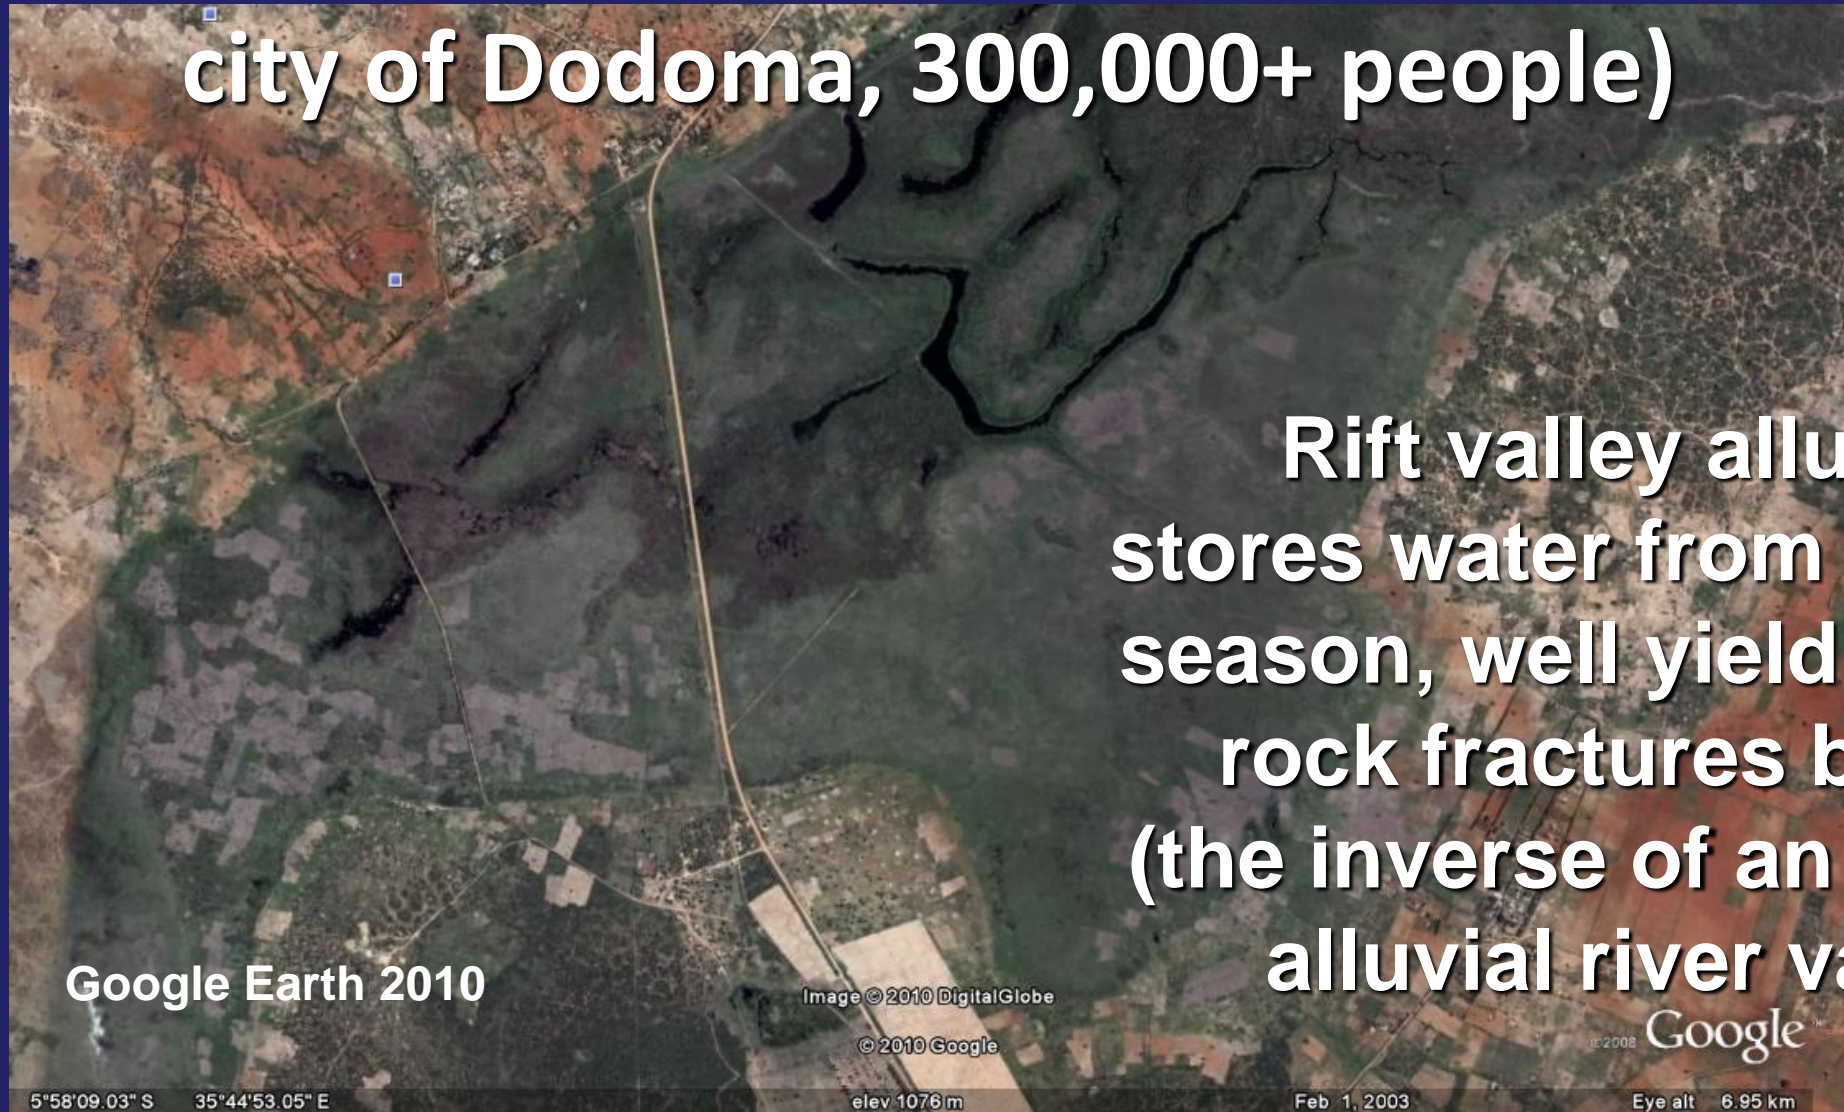

Very low hydraulic-conductivity bedrock

Direction of ground-water flow

Now for something completely different: Makutapora valley, Tanzania (wellfield for city of Dodoma, 300,000+ people)

city of Dodoma, 300,000+ people)

Rift valley alluvium
stores water from rainy
season, well yield from
rock fractures below
(the inverse of an Ohio
alluvial river valley)

Water Well Design, Construction, Testing

Resource planning and protection

There are limits to everything, even stupendously productive Ohio glacial-alluvial aquifers

- **manage them rationally**
- **and not “every man for himself”**

A Ground Water Source as Water Supply

- **Needed: Sufficient permeability and storage to supply the water to wells**
- **Needed: Sufficient recharge to replenish water extracted for water supply**
- **Needed: Absence of “deal-killer” water quality parameters**
- **Management: Protection of the resource for the long term**
- **Science: appropriate extraction design basis (not overdrafting), calculated long term (24 hr test may not do it)**
- **Engineering, craft: Wells/assets built for the long term**

**Geologist-led test drilling
provides extensive
information about a
potential wellfield location
in “real time”**

Ground Water Science
Science and Planning for Earth's Most Critical Resource

Geophysics: Ra

- Various methods depending on geology
- Pick drilling targets, reducing random drilling
- Or walk away without the expense
- Expert guidance and performance

We can predict water quality changes that will affect water treatment design using onsite methods

**We can predict mechanisms
that will degrade well
performance, and the timing
reasonably well – and you
really should plan accordingly**

Construction and contractor standards

- **Are we installing a lifetime potable water supply or a hole in the ground?**
- **Standards and specifications – assuring that proper materials and methods are used: very specific.**
- **Inspection – Meeting the specifications and good practice.**
- **Communication: To explain and correct**

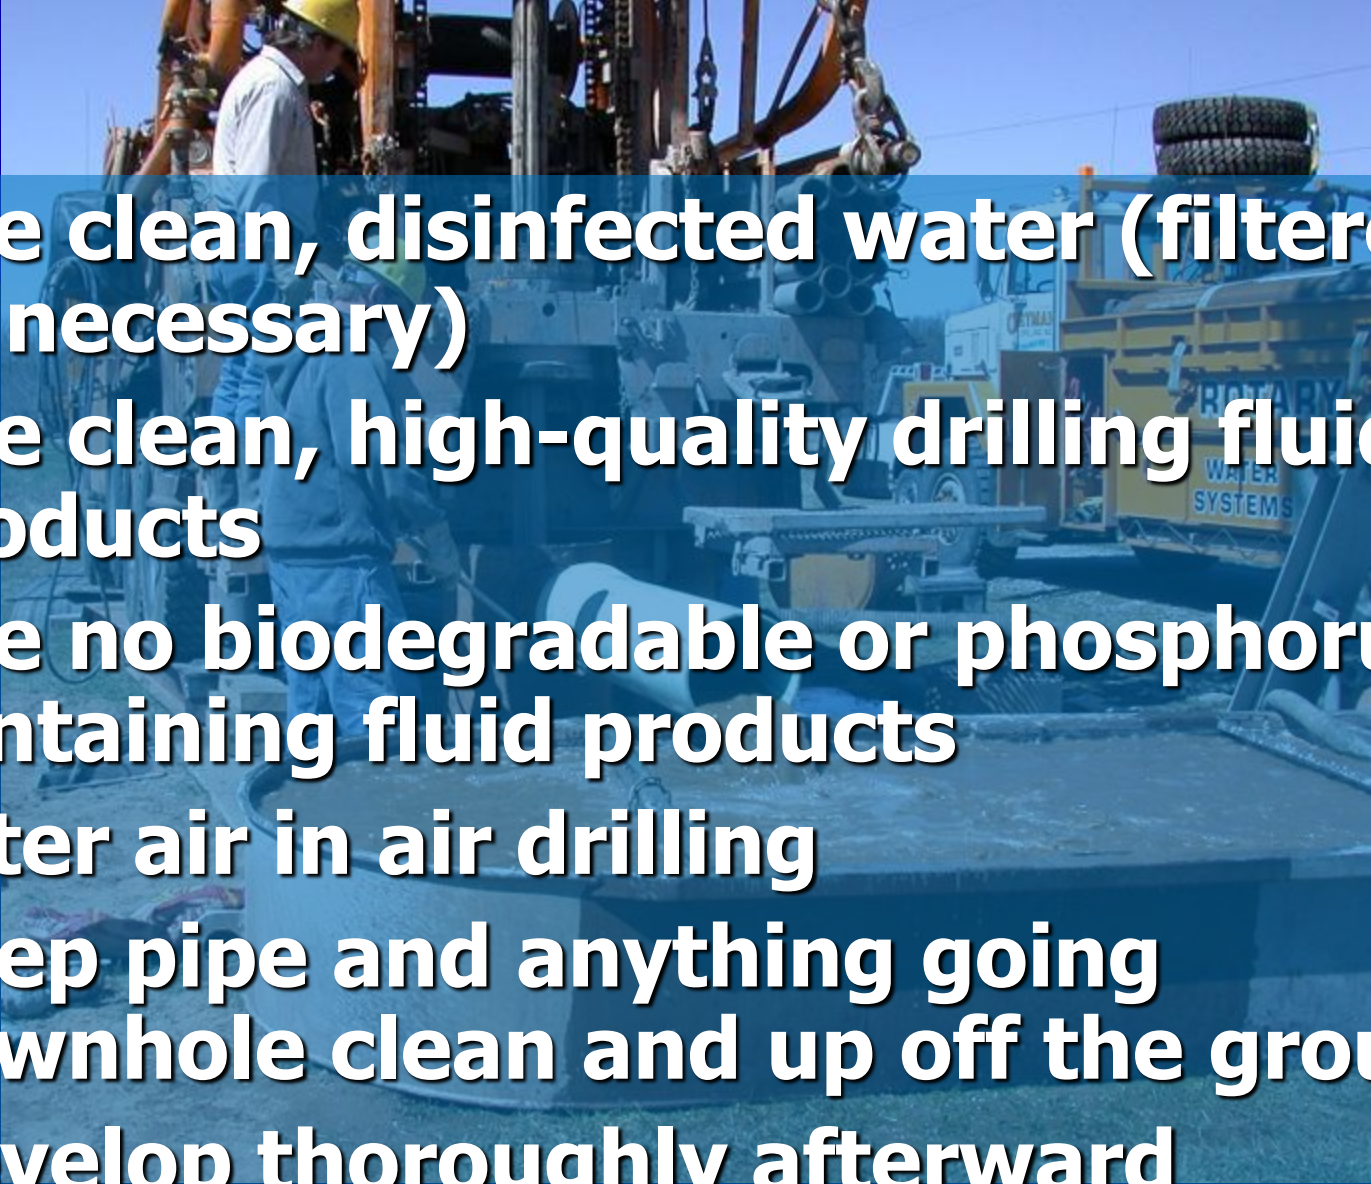

Construction: Follow “best practice” procedures

Ground Water Science
Science and Planning for Earth's Most Critical Resource

Preventive design

- 
- **As much open area as possible?**
 - **Filter pack round (less angular), clean, and silicate**
 - **Is this screen necessary?**
 - **Modern standards**

- 
- A photograph of a drilling site. In the foreground, a worker in a white shirt and yellow hard hat is operating a piece of machinery. In the background, another worker is visible, and a yellow truck with "ROTARY WATER SYSTEMS" written on it is parked. The scene is outdoors with a clear blue sky.
- **Use clean, disinfected water (filtered as necessary)**
 - **Use clean, high-quality drilling fluid products**
 - **Use no biodegradable or phosphorus-containing fluid products**
 - **Filter air in air drilling**
 - **Keep pipe and anything going downhole clean and up off the ground**
 - **Develop thoroughly afterward**

Post-construction Development: Backwash for your water well

Standards for:

Turbidity and sediment content, usually until water free of turbidity and sediment.

Well efficiency, usually until most effects of drilling are removed and well has good connection with aquifer.

Post-construction Development

- **Reduces impacts from drilling and well construction on the aquifer.**
(restores original permeability)
- **Improves the connection of the well with the aquifer and the flow of water into the well.**
(maximizes well efficiency)

Poorly

Developed

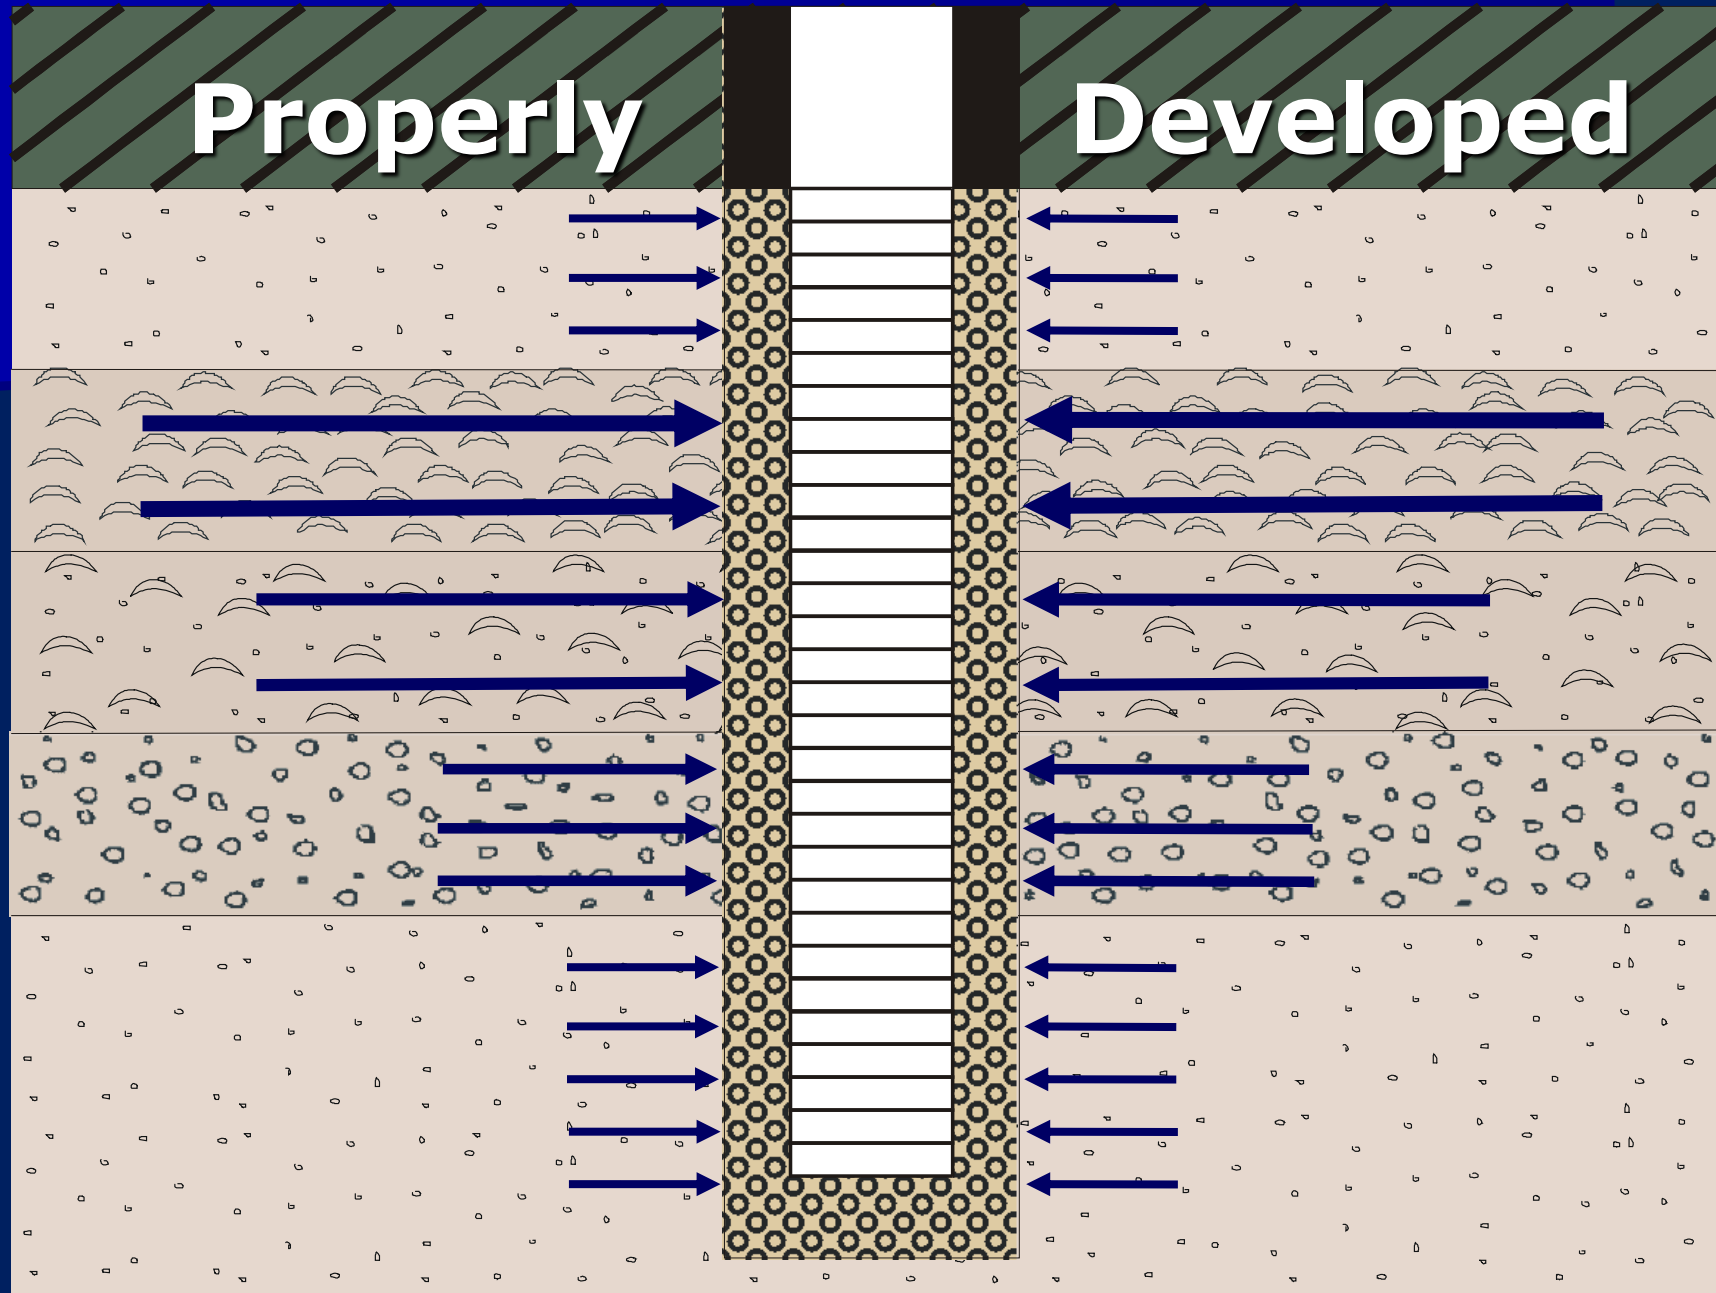

**Impedes
intake in-flow**

**Reactions with
water
constituents**

Properly

Developed

Secure the well top: Sanitary, secure

Sanitary, secure: well house

- Fenced, but crane access and room
- Overhead building access
- Line-of-sight from crane to casing top inside
- Room to work inside

Towers and valve pits

Various ideas

Drawdown in a Well

- Drawdown in a pumped well has two components:
- Aquifer losses
 - Head losses occurring in the aquifer where the flow is *laminar*
 - Vary linearly with the well discharge
- Well losses
 - Aquifer damage during construction
 - *Turbulent* friction losses adjacent to well, in the well and pipe

Why well efficiency is a concern to a major water producer:

This extra drawdown results in:

1. increased power consumption for pumping
2. greater wash zone in well, increased biofouling, greater rehab costs
3. less available drawdown, lower specific capacity

Testing wells for well and aquifer performance analysis

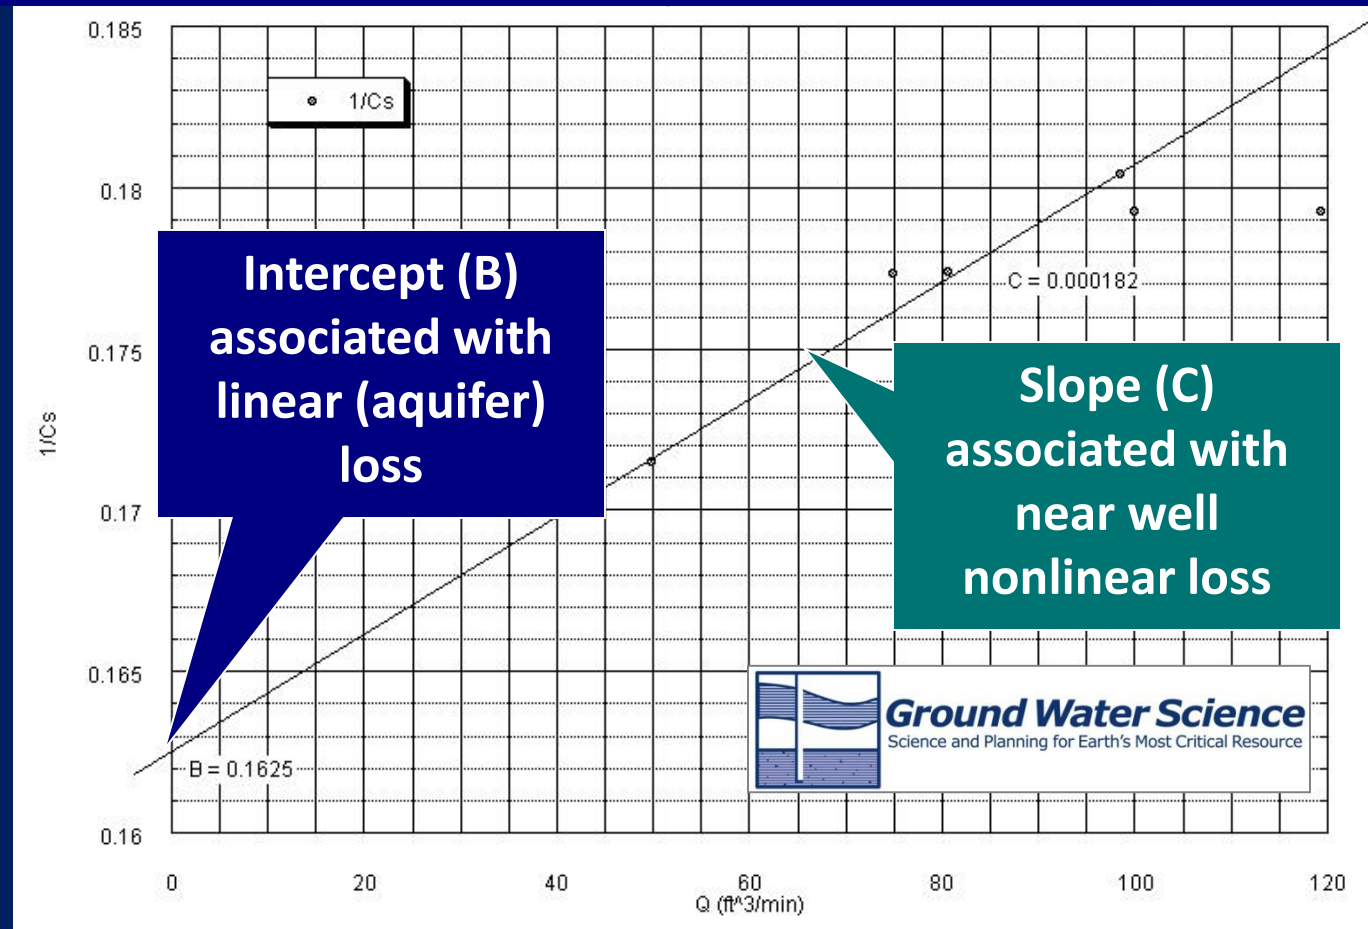

Ground Water Science
Science and Planning for Earth's Most Critical Resource

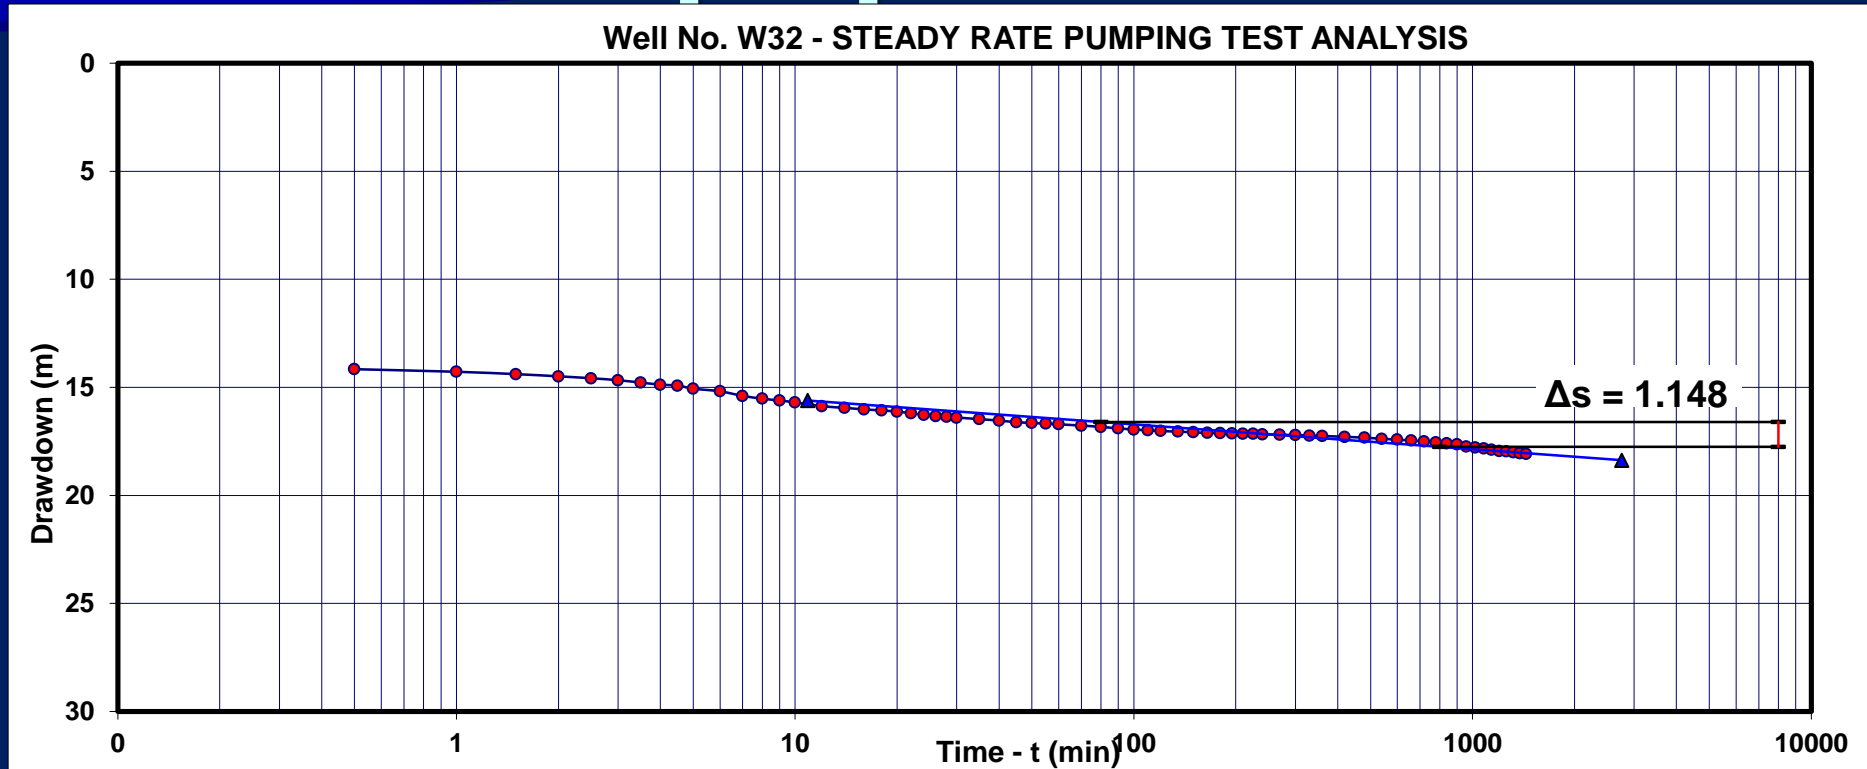

Well testing to evaluate yield, gauge effectiveness of well development or redevelopment

- Rig testing for preliminary tests
- Step testing to establish well properties: specific capacity, well loss and aquifer loss (by the book – do it right)
- Long-term constant-rate (“aquifer”) tests to define aquifer-scale hydrology (by the book)
- Biological and physical-chemical water quality
- Visual assessments of sediment and debris

Specific capacity not the whole story: Step-drawdown test analysis to determine well loss components

Analyzing constant-rate (aquifer) pumping tests: aquifer-scale properties

Cooper - Jacob Analysis: Transmissivity $T = 0.183 \times Q/\Delta s$ (m^2/s)

Start date and time	End date and time	Discharge-QAV	S.W.L.	Δs	Transmissivity - T	
11.10.2011	12.10.2011	(m^3/sec)	(mb.R.P)	(m)	(m^2/sec)	(m^2/d)
23:20	23:20	0.08021	136.85	1.148	1.28E-02	1.10E+03

Controls on well yield and specific capacity

- **Aquifer transmissivity (hydraulic conductivity x thickness)**
- **If unconfined (water table) aquifer, as T fluctuates, so does SC**
- **If aquifer is being dewatered, T and therefore SC decline**
- **Issues of original construction**
- **Clogging and attempts to reverse clogging**

The step-drawdown test and well performance parameters helps the operator:

- determine if drilling contractor met performance specifications**
- plan pump design and pump setting**
- choose an efficient or “sustainable” pumping rate**
- provide a baseline for monitoring performance changes**

Well test essentials

Ground Water Science
Science and Planning for Earth's Most Critical Resource

**Philosophical interlude:
Wells and wellfields are assets
requiring planning and
management**

Wellfield asset management

- The “wild” –
engineered interface
- Limited access
- Limited feedback

- Human and other environmental challenges
- Physical-chemical challenges
- Hydrologic issues
- Expensive and difficult to replace
- *Cannot afford NOT to plan for sustainability*

**Wellfields: Town,
municipal, industrial scale**

Finding places to site new wellfields ...

↓ Then: endless horizon

What Is Asset Management?

“A process for maintaining a desired level of customer service at the best appropriate cost.”

From USEPA ‘Asset Management 101’ presentation,
Office of Groundwater and Drinking Water, Drinking
Water Protection Division

Similar ideas

A scenic view of a large body of water, likely a lake or sea, under a sky with scattered clouds. The sun is low on the horizon, creating a golden glow and reflecting on the water's surface. In the foreground, a wooden post is secured with a thick, grey rope, forming a railing. The overall atmosphere is calm and serene.

- **Stewardship**
- **“Take care of _ and it’ll take care of you”**
- **Conservation of resources (and assets)**
- **Responsibility**

Many well owners' approach to potential well problems...

I don't see any problems, anyway do it next year

Theoretical Drawdown

Observed Drawdown

Static WL

Pumping WL

Poor original design, pump selection

Poor original development – drilling damage, clog starters

Anaerobic: sulfides, FeII, MnII

biofilm buildup, oxidation to FeIII, MnIV

Anaerobic buildup of deposits, silt, sand, unhygienic bacteria

CH₄, CO₂, carbonates, Sulfates, U, As ...

Microorganisms everywhere

We now know that many types of microorganisms are native or adapted to saturated sediments and rock, and are indeed present in significant numbers in most water supply aquifers, all over the world, even deep formations – but very commonly in shallow ones.

Weathered sandstone in Ohio

**There is not
much
keeping
bacteria
from moving
in the earth**

Redox gradations

**Reducing
(may
also be
black)**

Mn-oxidizing

Fe-oxidizing

***Bacteria accelerate Fe oxidation
and Enable Mn oxidation***

OK, friends, I deduce that we are participating in an iron geochemical cycle

Start fresh with a maintenance (or *asset management*) attitude (not because Senate Bill 2 makes you do it)

- **Understanding that deterioration can occur and can be slowed and prevented**
- **This understanding often comes after a bad experience**
- ***Institutional* commitment to system maintenance including the wellfields**
- **Having a written but flexible plan to follow**
- **Training (frankly, indoctrination) so it isn't followed blindly**

I LOVE duct tape!

Commitment of everyone involved

I fought for this AM program for better use of customer's money and better reliability!

Data and maintenance equal fewer problems... I understand

Training, indoctrination!

Source Water Protection

- U.S. EPA Safe Drinking Water Act, administered in Ohio by Ohio EPA for public water supplies
- Four part definition and action (surface & ground water):
 - SWAP delineation (a real hydrogeologic one – ideally with actual data)
 - Risk assessment within delineated SWAP
 - Management plan to defend the SWAP (SWPP)
 - Implement the SWPP (*the hard part*)
- Necessary for negotiation with E&P, ODNR, and others
- Must be technically rigorous – then *be serious and defend it! It's your water supply.*

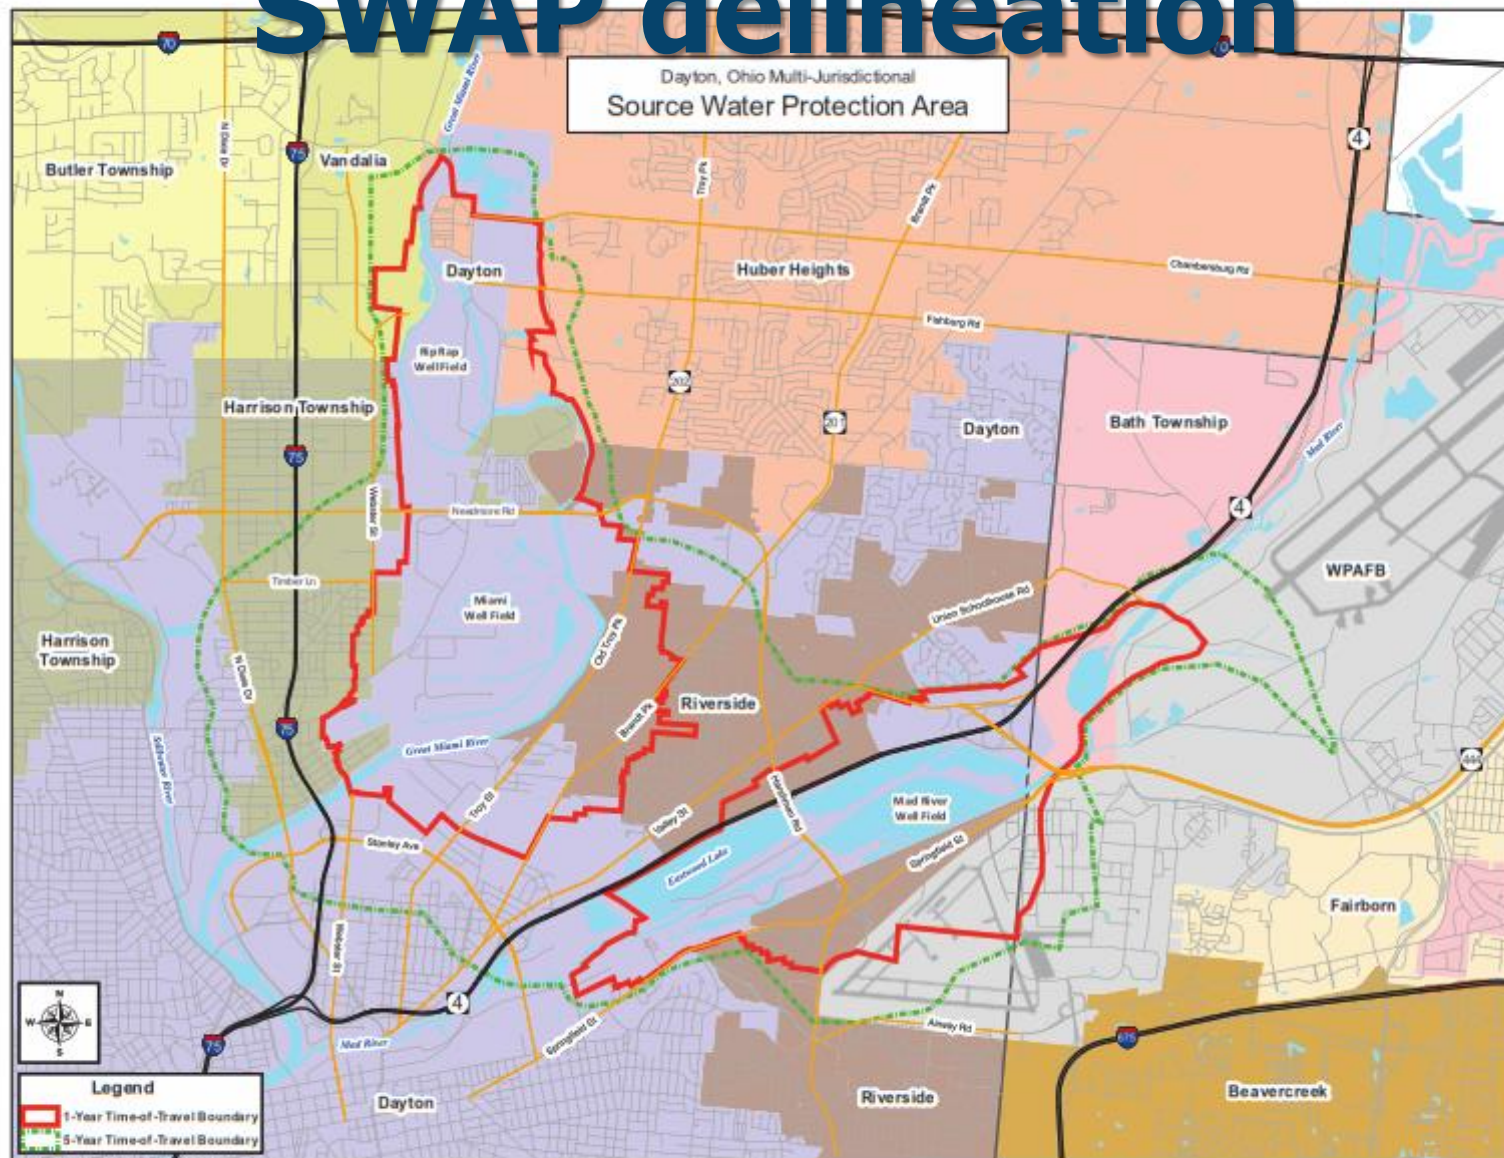

Source Water Protection and Monitoring task description

- **Literally this is asset management**
- Source water protection of a wellfield or surface water supply should be based on scientific analysis using site-specific and valid data
- Needed: active, regular water quality monitoring to detect contamination or change or to modify the risk assessment.

What can go wrong?

SWAP delineation

Plant Automation and Plant Intelligence

- **Do you have abundant data? *Plan* how to manage and use them...**
- **Automation (sensors, software) means you can do more with finite people and resources**
- **Much confusion, many options – plan to simplify and streamline**
- **How to access to use – yourselves, analysts working remotely?**

Then, use the information!

- **You do not have to guess and work in the dark**
- **Knowing your costs, hydrologic factors such as specific capacity, water quality, power usage**
- **Keeping good records to do this**
- **Know your benefits as well as costs**

Life-cycle cost

- **Life-cycle cost (LCC) is the total cost of owning a product for a period of time.**
- **LCC includes the costs of design, construction and purchase, operation, maintenance, renewal, replacement or disposal**

**You're joking, right?
I need to buy how
many acres of new
land?**

**We're
cleaning
the wells
no matter
what it
costs**

**Do the math,
but Probably
best to keep
what you have
in good shape**

**No, seriously,
you do! You
must have a
300-ft isolation
radius. I don't
know why.
Nobody does**

Potential Average Unit Rate of Infiltration

Cincinnati GWUDI study

Better ways to evaluate the real vulnerability of radial collectors

**Biochemical-
based microbial
ecology here
and here...**

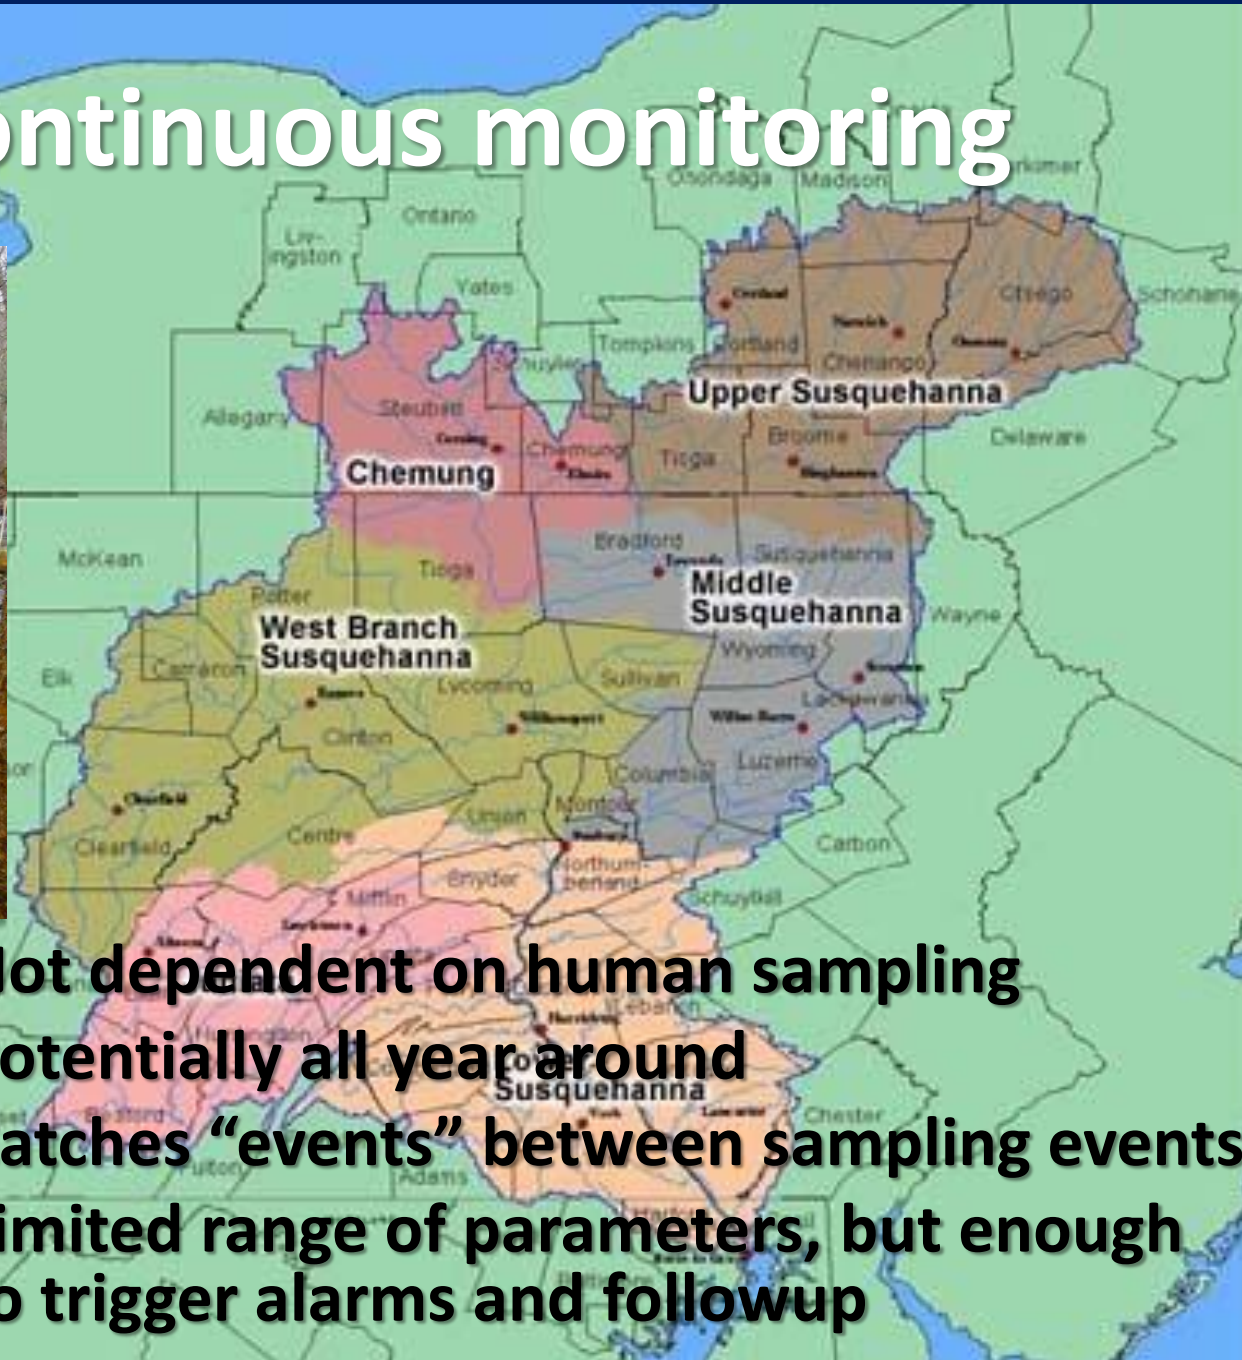

Continuous monitoring

Shop-built open-source monitor, design via Fondriest

- **Not dependent on human sampling**
- **Potentially all year around**
- **Catches “events” between sampling events**
- **Limited range of parameters, but enough to trigger alarms and followup**

Ljubjana River aquifer, Slovenia

Lake Bled

Through planning, monitoring and education, it is possible to provide high quality drinking water without treatment in a landscape occupied since before Roman times

Ljubljana, Slovenia: this could be your future

- Ljubljana water supply for 300,000 people
- Sava River aquifer
- *No water treatment filtration*
- *No chlorination* for > 120 years
- Safe (and really good tasting) water
- High nitrate outside pumping areas being mitigated
- Maintained through strict source water protection (urban and ag uses – centuries old)

OK, quick summary

- **Protect your assets (source water protection)**
- **Plan and design wells/wellfield scientifically**
- **Plan all based on life-cycle valuation**
- **Construct in a quality fashion**
- **Know the deteriorating factors and rates**
- **Practice preventive design and maintenance (don't wait until a well collapses, that sort of thing ...)**

**Any questions?
You can do
this.**

**I've got
time or stay
in touch**

**Did we mention
the book?**
