- Impact of accuracy on revenue

Accuracy = Revenue

- Improved meter accuracy means
 - More water measured through meters
 - Increased billing on water through the meters
 - Reduced Non-Revenue Water (NRW)

You want your meters to be as accurate as possible for as long as possible.

How accurate are your meters?

• How to test meters

- Volumetric vs gravimetric testing
- Importance of purge
- Importance of volume vs uncertainty

Meter Test Bench

- Volumetric testing device
- Actual volume of water measured through the meter
- Testing based on actual volume rather than another meter.

Volumetric Reference

- Accuracy = $\frac{Volume_{meter}}{Volume_{reference}} \times 100$
- Uses a calibrated tank for the reference volume
- The tank MUST be "wetted" (filled then emptied) prior to start of test
- Readings MUST be taken at the bottom of the meniscus

Gravimetric Reference

- Uses a tank that is set on a calibrated scale
 - Tank does not have to be "wetted" before testing
- *Volume_{reference}* is determined by:
 - $Volume_{reference} = \frac{Weight_{tank}}{Density_{water}}$

•
$$Density_{water} = 62.2975 \frac{lb_f}{ft^3} \sim 8.328 \frac{lb_f}{gal}$$
 at 70°F per NIST

Reading Error and Uncertainty

• As the volume of the test increases, the total test uncertainty decreases

What about static meters?

- Currently no AWWA Standard but meter requirements will be released...
 - AWWA C715 Cold Water Meters Electromagnetic and Ultrasonic Type for Revenue Applications
 - To be released by Q4 2018

What about testing static meters?

- Currently, not addressed by AWWA but...
- **AWWA M6** will be releasing an addendum to cover the electromagnetic and ultrasonic meter testing

2018 Addendum to

AWWA Manual M6, Water Meters—Selection, Installation, Testing, and Maintenance, Fifth Edition (2012)

Purpose of this Addendum

The purpose of this 2018 Addendum to AWWA Manual M6 on *Water Meters—Selection, Installation, Testing, and Maintenance,* fifth edition, is to provide guidance to users on testing procedures and related topics for meters conforming to ANSI/AWWA standard C715-18 on Cold Water Meters— Electromagnetic and Ultrasonic type, for Revenue Applications. This new standard was approved by the AWWA Standards Committee on Water Meters on February 19, 2018. It was approved by the AWWA Board of Directors on June 9, 2018, and made effective on November 1, 2018.

All these are 5/8" nutating disk meters.

Low flow accuracy drops first.

Mostly due to volume of water flow. Also water quality.

Warranties are created equal

For Positive Displacement Meters...

- 5/8" to 2"
 - Long-term proven history on Positive Displacement Meters
 - Similar accuracy warranties across vendors
 - Most vendors offer nutating disc or piston meters in this size

Not all warranties are created equal

For static meters...

- 5/8" to 1"
 - Similar accuracy warranties across vendors
 - Not all major vendors offer static meters in this size
- 1.5" and 2"
 - Dramatic differences in product offering and warranty
 - Not all major vendors offer static meters in this size

Take Aways

- Meter accuracy = revenue dollars
 - (in addition to reduced non-revenue water)
- Little water losses add up to big dollars over time
- All warranties are not the same
- Best long-term accuracy over the life of the meter PD vs. Static static meters (98.5% vs. 97.975%)
- Be sure to sure to compare the best warranty for all sizes

Large Meter Testing

On-site Testing Process

Water Meters Lose Accuracy Over Time

Results: lost revenue for the utility OR higher rates to recover losses

But, which meters are losing money?

"Biggest Bang for the Buck"

Focus on the Commercial and Industrial Meters Often, <u>less than 5%</u> of a utility's meters <u>generate</u> <u>more than 40% of the</u> revenue

Testing Methods

- Meter Testers
 - Master Meter (volume to volume)
 - Typical meter tester sizes 3" and 4"

Things to Remember

- Meter testers cannot test the full range of a meter
- Provides a snap shot only
- Start at low flows, then medium, and high flow rates
- If a test fails, repeat it to verify result.
- Ensure and verify meter can be isolated
- Cavitation (maintain 20-30 psi at tester)
- Meter Tester is not 100% accurate at all flow rates.
- Calibration certificate

Portable Field Testing Equipment

- Conduct Field testing with Test meter in location where it is being used
- Accuracy Testing Site meter with a known test meter
- Water runs through the site meter and then through the test meter
