

These days next to your mortgage, a family utility bill such as electricity is a big chunk of your yearly budget

If you are considering putting Solar Power on your new or existing home – make sure you understand what the benefit will be to you before forking out hard earned money.

One suggestion is that if you are building, ask your builder to include Solar Power - so you can include it in your mortgage repayments.

This is much more cost effective way of adding in Solar Power and you will be amazed at how much it will impact your monthly budget while adding value to your home.

Did you know that when comparing your electricity bill to having Solar on your mortgage on average you will be \$880 a year better off – we have the figures to show you!

THINGS TO CONSIDER

Before Purchasing Solar Power!

Sunrise Solar Australia

Some things to consider before investing in **SOLAR POWER**

Seven things to consider

1. Confusing day light hours with sun hours

- Sun light hours are different to daylight hours. It is the sun light hours that allow the panels to generate energy so make sure you get the right advice wrong input = wrong output!

2. Understanding your power consumption

- Check the energy consumption of key appliances or devices in your home. These days modern appliances have a star rating which displays the KW/h per year that appliance consumes.

3. Not decreasing your usage first

- If you are serious about reducing your energy bills, then why not replace all your lighting with LED's? Are you using all those fridges in the house? We can even show you how to save energy by scheduling some activities such as dish washers and pool pumps, during daylight hours when the panels are active.

“ After all you would not buy a home without knowing how many people are going to live in it”

4. Unrealistic expectations

- Beware of cheap Solar Kits they may look like good value but can be deceiving. Look for Tier 1 brands and CEC accredited installers.

5. Bad Solar Panel installation

- In Australia your panels should face north, however, if you have limited roof space west may be your best option – but make sure you get sound professional advice. Considerations like Solar Panel angle, and air flow all make a difference to the efficiency of the system.

6. Considering a deal that sounds too good to be true

- Don't take the TV or on-line deal that sounds too good to be true-it normally is. Be wary as they may offer inferior panels instead of Tier 1.

7. Buying before defining your load

- Make sure you have done your homework – after all you would not buy a home without knowing how many people are going to live in it!

Other Considerations:

Is Solar for you?

- Just because a friend has installed Solar Power does not mean it is right for you.

Is it financially viable?

- How much do you currently pay over a year for electricity?
- Tread cautiously with zero interest offers!
