

Personalized Cellular Nutrition

Help your patients achieve vibrant longevity with personalized cellular nutrition.

This two-part personalized program analyzes cellular micronutrient levels, genetics, and lifestyle to create supplements specific to each patient's unique cellular needs.

Why Personalized Cellular Nutrition?

Differences in biochemistry, metabolism, genetics, lifestyle, and gut health can result in vastly different nutritional requirements.

One-size-fits-all supplements put patients at risk of under or overdosing on vital vitamins and minerals.

But with our advanced cellular and genetic testing, you can ensure your patients receive the precise therapeutic dosage they need for optimal health—no more, no less.

How It Works

The NutriProZ Longevity Program is a two-part system that combines cellular nutrient and genetic testing with a comprehensive lifestyle assessment to develop optimized personalized supplements that improve biochemistry for increased health span.

Part I: Longevity Starter Plan

Part I evaluates your patient's lifestyle, genetics, and cellular nutrient levels to create supplement regimens that support their unique nutrient needs.

1 Lifestyle Assessment

Our unique lifestyle assessment gathers critical information about diet, physical activity, sleep habits, medications, and more to understand your patient's needs.

2 Cellular Genetic Nutrient Testing

Our advanced precision technology measures your patient's genetics and cellular micronutrient levels to optimize nutrition by:

- Measuring direct levels of intracellular and extracellular micronutrients using serum and white and red blood cells
- Identifying genetic variations that impact cellular absorption and utilization of nutrients
- Determining the scope of genetic predispositions affecting nutrient absorption, transport, conversion to absorbable forms, and cellular uptake

3 Interactive Personalized Report

An interactive, detailed report provides a complete picture of nutritional needs, nutrient status, and personalized recommendations.

4 Personalized Cellular Nutraceuticals

Your patient receives a 3-month supply of high-quality, compound supplements formulated for their precise cellular needs, genetic profile, and lifestyle. Each personalized dose replaces up to 70 different supplements.

All supplements are:

- Produced in a US-based NSF-certified, FDA-registered, and GMP-registered facility
- Made-to-order with physician-grade ingredients to ensure freshness, absorption, and efficacy
- Compounded formulas, resulting in fewer pills, simplified doses, and improved patient compliance

Part II: Longevity Maintenance Plan

Part II uses Micronutrient Testing to further optimize your patient's supplement blend for long-lasting health and vitality.

1

Micronutrient Intra-and Extra-cellular Testing

At the completion of the Starter Plan, measure your patient's intra-and-extra cellular micronutrient levels to reveal if nutrient needs have changed, including: vitamins, minerals, co-factors, amino acids, and essential fatty acids.

2

Interactive Personalized Report

After micronutrient testing, your patient receives an updated interactive report detailing how their nutritional needs have changed and providing updated personalized recommendations.

3

Premium Personalized Cellular Nutraceuticals

Choose a 3- or 6-month supply of precision compound supplements, re-formulated as needed for your patient's current micronutrient needs.
