

STOP LIME DOWN

In order to link the Lime Down solar installation to the national grid, cables will need to be laid along the almost 20km between the solar power station and the connection near Melksham, creating massive disruption as the route is established – involving tunnelling under the M4 – and the cables are installed.

Abnormal traffic, of a size and volume to which roads are unaccustomed and unsuited, will become a daily burden through the years of construction and installation.
