**Standard vaccines increase HIV-1 transcription during antiretroviral therapy.**

Yek C<sup>1</sup>, Gianella S, Plana M, Castro P, Scheffler K, Garcia E, Massanella M, Smith DM.

Author information

**Abstract**

**OBJECTIVES:** Curative strategies using agents to perturb the HIV reservoir have demonstrated only modest activity, whereas increases in viremia after standard vaccination have been described. We investigated whether vaccination against non-HIV pathogens can induce HIV transcription and thereby play a role in future eradication strategies.

## Ebola In The Air: What Science Says About How The Virus Spreads

DECEMBER 01, 2014 12:29 PM ET

MICHAELEEN DOUCLEFF

Viruses can spread through the air in two ways: inside large droplets that fall quickly to the ground (red), or inside tiny droplets that float in the air (gray). In the first route, called droplet transmission, the virus can spread only about 3 to 6 feet from an infected person. In the second route, called airborne transmission, the virus can travel 30 feet or more.

Adam Collis/NIFF

Here's an Ebola puzzle for you: If the virus isn't airborne, why do doctors and nurses need to wear full protective suits, with face masks, while treating patients?

▶ Harold Varmus was NIH Director who implemented the xenotransplantation program in 1999. This included xenografts for cancer research, gene therapy. Varmus also started the NIH Vaccine Research Program.

▶ Many infectious diseases of animals can be transmitted to humans via routine exposure to or consumption of animals (e.g., rabies). Viruses that are not pathogenic in their natural host reservoirs may, in some cases, be highly pathogenic when transmitted to a new host species. Several zoonotic viruses have produced significant outbreaks when introduced into human hosts under normal circumstances of exposure (e.g., Ebola, Hanta Virus, Influenza).

### In Brief

Multicomponent viruses, which separately package different genome segments, were thought to be restricted to plant and fungal hosts. Ladner et al. characterize a multicomponent mosquito virus and describe an evolutionarily related, segmented virus in a nonhuman primate. These findings provide evidence for multicomponent animal viruses and suggest relevance to animal health.

## Endogenous Deficiency of Glutathione as the Most Likely Cause of Serious Manifestations and Death in COVID-19 Patients

[Alexey Polonikov<sup>MD</sup>](#)

▶ Author information ▶ Article notes ▶ Copyright and License information ▶ [Disclaimer](#)

Endogenous glutathione deficiency appears to be a crucial factor enhancing SARS-CoV-2-induced oxidative damage of the lung and, as a result, leads to serious manifestations, such as acute respiratory distress syndrome, multiorgan failure, and death in COVID-19 patients. When the antiviral activity of GSH is taken into account, individuals with glutathione deficiency seem to have a higher susceptibility for uncontrolled replication of SARS-CoV-2 virus and thereby suffer from an increasing viral load. The severity of clinical manifestations in COVID-19 patients is apparently determined by the degree of impaired redox homeostasis attributable to the deficiency of reduced glutathione and increased ROS production. This assumption can be supported by our findings. In particular, COVID-19 patients with moderate and severe illness had lower levels of glutathione, higher ROS levels, and greater redox status (ROS/GSH ratio) than COVID-19 patients with a mild illness. Long-term and severe manifestations of COVID-19 infection in one of our patients with marked glutathione deficiency suggest that the degree of glutathione decrease correlates negatively with viral replication rate and that an increasing viral load exacerbates oxidative damage of the lung. This finding suggests that the virus cannot actively replicate at higher levels of cellular glutathione, and therefore, milder clinical symptoms are observed with lower viral loads.

Nitric oxide is a soluble gas that is continually being made from arginine in endothelial cells. Endothelial cells comprise a layer of cells inside the lining of our blood vessels.

**Vitamin D<sub>3</sub>, L-Arginine, L-Citrulline, and Antioxidant Supplementation Enhances Nitric Oxide Bioavailability and Reduces Oxidative Stress in the Vascular Endothelium – Clinical Implications for Cardiovascular System**

**Hazem Dawoud, Tadeusz Malinski**  
 Department of Chemistry and Biochemistry, Nanomedical Research Laboratories, Ohio University, Athens, Ohio, USA

**ABSTRACT**  
**Background:** Nitric oxide (NO) is a crucial signaling molecule which regulates the blood flow and prevents the adhesion of blood components to the vascular wall. A deficiency in bioavailable NO concentration is associated with the dysfunction of endothelial NO synthase (eNOS) and/or an increase in oxidative stress. The deficiency of bioavailable NO is a common denominator of several cardiovascular diseases, including diabetes, atherosclerosis, and hypertension. **Materials and Methods:** We used a nanomedical technology to elucidate the balance between bioavailable NO and oxidative stress (peroxynitrite ONOO<sup>-</sup>) in human umbilical vein endothelial cells (HUVECs) treated with a supplement containing L-arginine, L-citrulline, Vitamin D<sub>3</sub>, and antioxidants. Nanoprobes, with a diameter of 200–300 nm, are capable of measuring *in situ* NO and peroxynitrite (ONOO<sup>-</sup>) concentrations produced by single endothelial cells. **Results:** The ratio of the concentration of cytoprotective NO (NO) to the concentration of cytotoxic peroxynitrite (ONOO<sup>-</sup>) was used to estimate the efficiency of eNOS. HUVECs incubated with L-citrulline, L-arginine, and Vitamin D<sub>3</sub> increased the [NO]/[ONOO<sup>-</sup>] ratio by 25%, while in the presence of antioxidants, the increase was 15%. The synergistic effect between the mix of L-arginine, L-citrulline, Vitamin D<sub>3</sub>, and antioxidants was a favorable increase of the overall [NO]/[ONOO<sup>-</sup>] ratio by 50%. **Conclusion:** The findings of the study presented here clearly indicate that L-arginine, L-citrulline, and Vitamin D<sub>3</sub> can significantly alter the function of the endothelium and NO production, in a favorable manner, while possibly reducing ONOO<sup>-</sup> – the main component of oxidative stress. This effect can be significantly potentiated in the presence of antioxidants. **Key words:** Antioxidant, endothelium, L-arginine, L-citrulline, nitric oxide, peroxynitrite, Vitamin D<sub>3</sub>.

**SUMMARY**  
 • Nanomedical studies were used to elucidate the role of a mixture of Vitamin D<sub>3</sub>, L-arginine, L-citrulline, and several antioxidants in the improvement of nitric oxide production and the reduction of oxidative stress in human endothelial cells. It appears that the combination of natural products can effectively improve endothelial function by about 50% and has shown that, on cellular models, it could potentially be used to improve the endothelial function in cardiovascular diseases.

**Introduction**  
 Nitric oxide (NO) is a gaseous molecule that is generated by the NO synthase (NOS) enzyme. NO is synthesized from two substrates: L-arginine (non-essential amino acid) and oxygen.<sup>1,2</sup> This synthesis occurs through NOS in a five-electron transfer oxidation of L-arginine to L-citrulline. NOS is located in the membrane of endothelial cells, and its synthesis is stimulated by calcium flux.<sup>3–6</sup> In the cardiovascular system, the calcium flux is triggered by a mechanical process (shear stress)<sup>6</sup> and chemical stimuli such as acetylcholine, norepinephrine, angiotensin II, and many others.<sup>14,7</sup>

NO can react rapidly with many biological components, including superoxide (O<sub>2</sub><sup>-</sup>), Fe (III) of hemoglobin, guanylate cyclase, and many others.<sup>8–10</sup> Therefore, the measurement of reactive “free” NO is a challenging problem. In our laboratories, we are able to perform measurements of bioavailable NO produced by a single endothelial cell in different segments of the cardiovascular system, such as capillary vessels, aorta, and heart. Maximal NO concentrations vary significantly, depending on the location of the endothelial cells – with the lowest concentrations in the small capillary (about 80 nM) and the highest in the endocardium of the heart (about 2.0 μM).<sup>11</sup> The level of NO concentration depends largely on the velocity and type of blood flow (laminar vs. turbulent).<sup>12–14</sup>

# Fauci's Trojan horse Poisons Remdesivir and Paxlovid "Ivermectin" with Cyanide & Fluorine

**Cyanide**  
From Wikipedia, the free encyclopedia

This article is about the class of chemical compounds. For other uses, see *Cyanide (disambiguation)*.

A **cyanide** is a chemical compound that contains the group C≡N. This group, known as the **ciano group**, consists of a carbon atom triple-bonded to a nitrogen atom.<sup>[1]</sup>

In inorganic cyanides, the cyanide group is present as the anion CN<sup>-</sup>. Soluble salts such as sodium cyanide and **potassium cyanide** are highly toxic.<sup>[2]</sup> **Hydrocyanic acid**, also known as hydrogen cyanide, or HCN, is a highly volatile liquid that is produced on a large scale industrially. It is obtained by acidification of cyanide salts.

**Organic cyanides** are usually called **nitriles**. In nitriles, the CN group is linked by a covalent bond to carbon. For example, in acetonitrile, the cyanide group is bonded to methyl (CH<sub>3</sub>). Although nitriles generally do not release cyanide ions, the cyanohydrins do and are thus rather toxic.

God Given IMMUNITY**

I, (Name) \_\_\_\_\_, the undersigned do hereby swear and affirm that I am a member of a recognized religious organization, and that the immunizations required by (Governing Authority Name) \_\_\_\_\_, are contrary to my religious tenets and practices. On this basis, as no vaccination on the CDC schedule has been safety tested as acknowledged by the CDC in 2019 and EUA COVID19 inoculations/immunization requirements violate my right to freely exercise my religion as guaranteed by the First Amendment of the Constitution of The United States of America, I am asserting my rights to an exemption by (Governing Authority Name) \_\_\_\_\_ from EUA Inoculation and nasal Swab PCR test requirements as I am immunized/vaccinated by virtue of the robust natural immunity I acquired when I recovered from COVID19.

I also am immunized according to my religious beliefs as I regularly take oral booster. My immunization strategy **exceeds** FDA and CDC mandated standards, which were recently changed such that the vaccination need not provide immunity.

I qualify for this exemption based on the First Amendment of the United States Constitution and *42 U.S. Code § 2000a - Prohibition against discrimination or segregation in places of public accommodation*, which states "All persons shall be entitled to the full and equal enjoyment of the goods, services, facilities, privileges, advantages, and accommodations of any place of public accommodation, as defined in this section, without discrimination or segregation on the ground of race, color, religion, or national origin." Failure to uphold 42 U.S. Code § 2000a may be met with legal action.

Thank you in advance

SARS CoV 2 (COVID-19) Tests		
Test Name	Result	Reference Range
SARS CoV 2 AB (IgG) NUCLEOCAPSID, QL		
SARS CoV 2 AB IGG	POSITIVE	
Reference range: Negative		
<p>This test is intended for use as an aid in identifying individuals with an adaptive immune response to SARS-CoV-2, indicating infection. Results are for the detection of SARS-CoV-2 antibodies. IgG antibodies to SARS-CoV-2 are generally detectable several days after initial infection, although the duration of time antibodies are present post-infection is not well characterized. It is not known for how long antibodies persist following infection and if the presence of antibodies confers protective immunity. Infection by detectable virus by molecular testing present for several weeks following seroconversion. Negative results do not preclude infection. This test should not be used to diagnose acute SARS-CoV-2 infection. If acute infection is suspected, direct testing methods for SARS-CoV-2 is necessary. False positive results for the test may occur due to cross-reactivity from pre-existing antibodies to other possible causes.</p> <p>Please review the "Fact Sheets" available for health care providers and patients using the following websites: <a href="http://QuestDiagnostics.com/Covid-19/HCP/antibody/fact-sheet2">QuestDiagnostics.com/Covid-19/HCP/antibody/fact-sheet2</a> <a href="http://QuestDiagnostics.com/home/Covid-19/Patients/antibody/fact-sheet2">QuestDiagnostics.com/home/Covid-19/Patients/antibody/fact-sheet2</a></p> <p>This test has been authorized by the FDA under an Emergency Use Authorization (EUA) for use by authorized laboratories. The authorized labeling is available on the Quest Diagnostics website <a href="http://www.questdiagnostics.com/Covid19">www.questdiagnostics.com/Covid19</a>.</p> <p>For additional information please refer to <a href="http://education.questdiagnostics.com/faq/FAQ219">http://education.questdiagnostics.com/faq/FAQ219</a> (This link is being provided for informational purposes only.)</p>		
SARS COV 2 AB, TOTAL SPIKE SEMI QN	417.4 H	<0.8 U/mL
INDEX	INTERPRETATION	
<0.8	Negative	
> or = 0.8	Positive	
<p>This test is intended to help identify individuals with antibodies to SARS-CoV-2 (COVID-19). The results of this semi-quantitative test do not indicate the degree of immunity or protection from reinfection.</p>

## Quote by Thomas Jefferson

"If people let the government decide what foods they eat and what medicines they take, their bodies will soon be in as sorry a state as are the souls who live under tyranny." -- Thomas Jefferson
