

# Ultralok® Tooth System

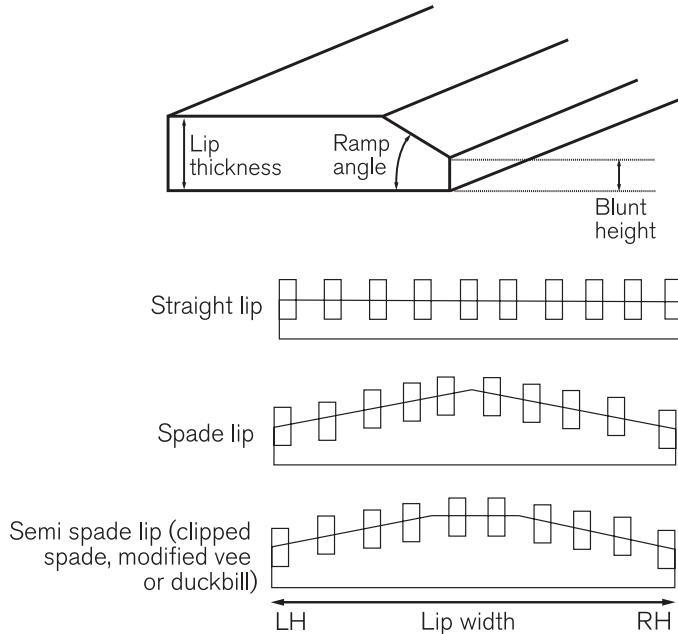

## Ultralok® Point and Adapter Selection Instructions

Proper selection of the points and adapters to match the machine and application is very important for maximum performance. The ESCO Specifications Catalog is designed to make the selection quick and easy. Just follow the simple instructions below. If you have any questions, please contact your ESCO representative.

### Adapter Selection

Adapters cannot be easily changed so careful evaluation of the machine and application are important.

The information needed is lip thickness, ramp angle, straight, spade or semi spade lip (refer to illustrations below), machine make and model, and application. Do not make assumptions on the lip dimensions based on the machine. Many times the lip may be a custom size or has been replaced with a size different from the factory original. For bolt-on adapters the hole spacing is critical and needs to be accurately measured on the lip.

First, find the machine make and model listed in the Nose Sizes Recommendation Chart. Then select the nose size for the machine and application (STD/HD or XHD). To assist in the application type there are definitions on the next page.

Once the nose size is determined, go to the appropriate section and find the page listing parts in that nose size. Using the lip dimensional information, determine which adapter(s) will fit. Then select the style that closely matches the application needs. Note that adapters are listed by category (Excavator, Loader, Misc.).

To help with selection, general purpose (STD/HD) wheel loader applications typically use flush mount (Type 1) adapters. Heavy-duty and Extreme-Duty (XHD) applications for wheel loaders typically use 1-1/2 top leg (Type 4 or 5). Two leg (Type 10) are used only in hot slag or extreme abrasion. For many of the loader adapters there are left and right versions for spade or duckbill lips. These are designated with an "L" or "R" after the adapter shank prefix (i.e. 1810L-U45 and 1810R-U45). Excavators typically use 1½ bottom leg (Type 8) adapters for all applications. For general purpose applications in the smaller nose sizes there are 1¼ bottom leg (Type 7) adapters available. In the "Machine Type" column for each adapter pattern number is the specific make and model or machine type the given adapter pattern number is typically used on.

The last thing to determine is the number of adapters needed for a given lip width. If you are not sure of the number of positions the bucket should have, a good rule of thumb is to have spacing of 1½ adapter widths between adapters for excavator applications, and 2½ adapter widths for loader applications. Remember, the reason for points and adapters is to help the machine dig (penetration), but too many positions can reduce penetration. Wear protection is secondary. The more adapters the less lip wear. If the calculation for the number of adapters does not come out even, take these into consideration for choosing to go with one more or one less adapter.

## Point Selection

When selecting a tooth shape there are several key areas to look at. Also, what tooth style was previously used and did it perform satisfactorily. Even if it was not an ESCO design, it can give an indication of a style to match or a style to avoid.

Consider the loading, penetration, abrasion, and impact needs. These can be based on application, machine make and model, and the material to be handled. Then go to the page listing the size of points to match the nose size selected. The Ultralok® locking device is an integral part of each Ultralok point. Each point has a description of its performance characteristics (penetration, abrasion, rock, chisel, etc.). Following is a functional description of the Ultralok point shapes.

## Ultralok Point Shapes Recommendations

- **S** – Standard point, general purpose shape for use on both excavators and wheel loaders. Designed to wear sharp to maintain penetration, and features a center rib for greater strength. An excellent choice for general purpose applications.
- **C** – Chisel point, primarily for use on excavators. The design provides good penetration and extra wear metal in tough applications. The heavy-duty rib and unique tear-drop relief in the bottom keep the point sharp throughout its wear life.
- **H** – Heavy point, for extremely abrasive applications and is primarily designed for excavators. Additional wear metal provides for long point life. The heavy-duty rib and unique tear-drop relief in the bottom help to maintain sharpness as the point wears.
- **P** – Pick point, is for extremely hard to penetrate materials, and is primarily designed for excavators but can be used on wheel loaders when conditions warrant it. Ribs on both the top and bottom provide strength and allow the point to stay sharp throughout its wear life.
- **T** – Twin pick point, is for maximum performance in hard to penetrate materials. The unique configuration minimizes the chance of rocks becoming wedged between the tines. The twin pick shape is designed to be used in corner positions in conjunction with the P style point to cut clearance for the buckets' sides. Each corner can be switched with the opposite corner to maximize wear life.
- **F** – Flared point, is for general purpose digging, clean-up and applications where a continuous edge may be used. The wide blade maximizes bucket capacity and is an excellent choice for trench bottoms and foundations excavations.
- **AP** – Abrasion-Penetration point, is a heavy-duty penetration point for wheel loaders with added wear metal for highly abrasive applications. The beveled tip design ensures sharpness, and the top center rib helps maintain the sharpness as the point wears. A wear shoe is integrated into the bottom to provide long life.
- **A** – Heavy-Abrasion point, is design for optimum wear on wheel loaders working in extreme abrasion applications. The point tip is beveled and the top contoured panel ensures excellent material flow into the bucket. A bottom wear shoe runs the whole length of the point for maximum wear life and ensures a smooth floor to minimize the chance of tire damage.

## Point and Adapter Numbering System

The last two numbers in each adapter pattern number signify the nose size. The same number is used in the equivalent size of point. The letters which follow the size number indicate the specific point shape.

Component	Ultralok® Pattern No.
Adapter	1810-U45
Point	<b>U45AP</b>

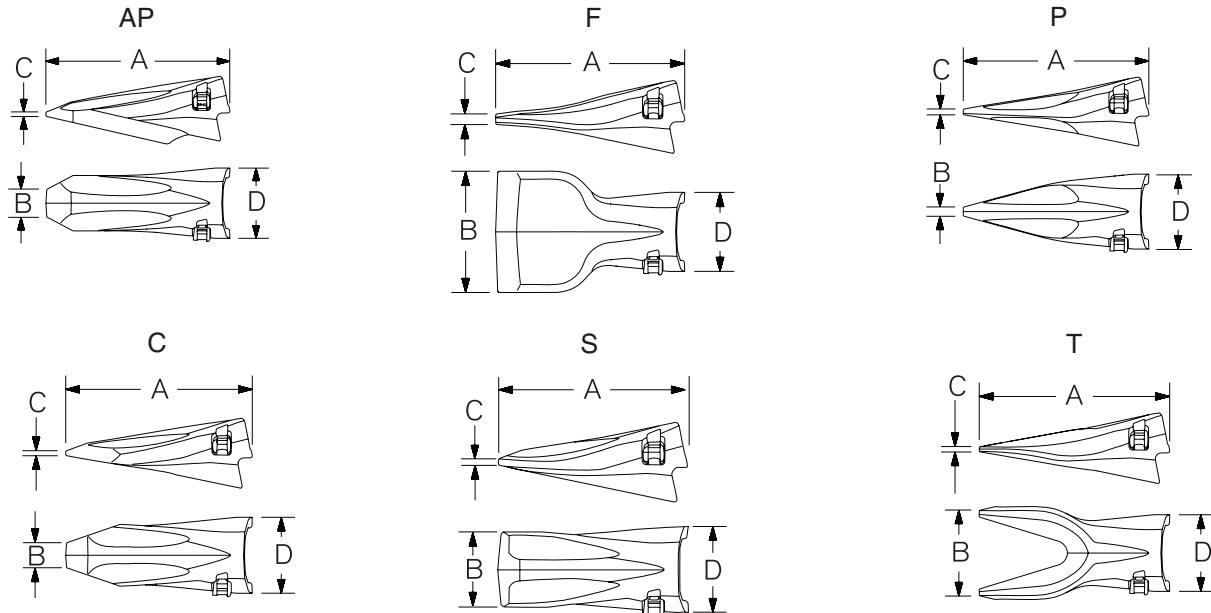

It is not important to memorize adapter pattern numbers, but it is helpful to know the third number to the left of the nose size indicates the type of adapter. Following are some examples.

- Weld-on adapters have an “8” three digits to the left of the nose size. For example: 833-U20, 1837A-U40, 1852-U55.
- Bolt-on adapters have a “7” three digits to the left of the nose size. For example: 8705-U25, 3766A-U30, 5722-U35.

## Application Definition

- **GP / STD (General Purpose / Standard Duty)** – Light, loose, well-shot material such as dirt, clay, sand, gravel (not cemented), shot or friable coal or shale. Puts very little load on the equipment and uses minimum machine power.
- **HD (Heavy Duty)** – Medium to heavy, shot material (not tight or large slabs), such as rocky overburden or ore, unshot lens or partings of cemented material of rock which will easily break up into manageable sizes when excavated. Requires a moderate amount of machine power but at times can apply high loads on the equipment.
- **XHD (Extra Heavy or Severe Duty, Rock Application)** – Heavy ore or unshot rock, tight or slabby shot rock that requires maximum or near maximum machine power to break out. Such applications usually cause the machine to rock during the digging cycle, and many times is accompanied by smoke where the tooth engages the material. Puts maximum loads on the equipment during most of the operation.
