

How we Pollinate our Clivia

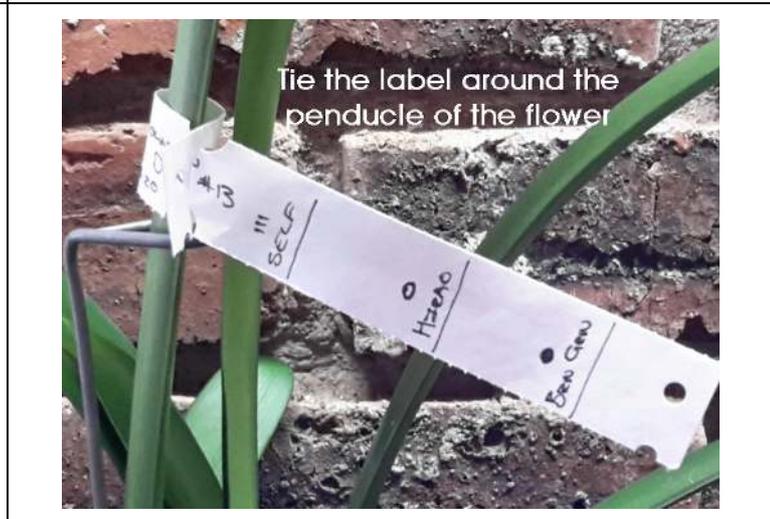

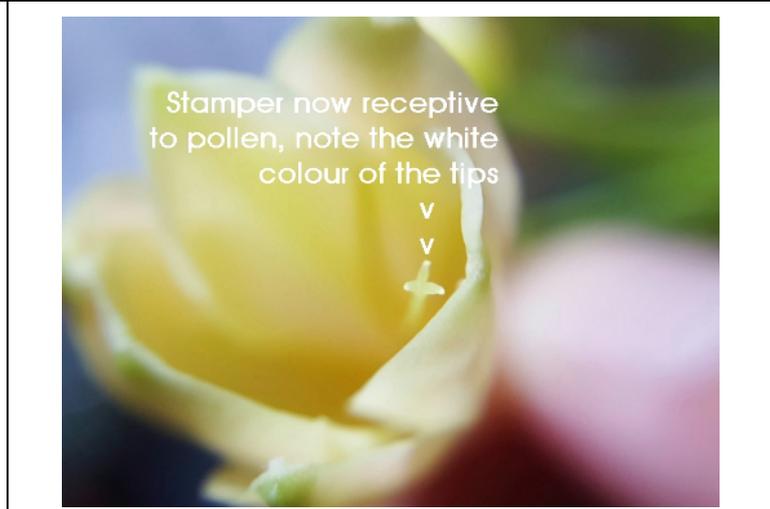

How we Pollinate our Clivia

How we Pollinate our Clivia

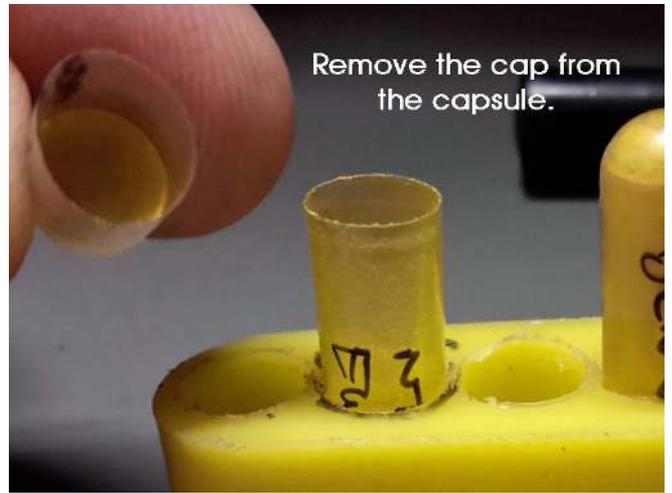

How we Pollinate our Clivia

Stored Pollen in gel capsules

Remove the cap from the capsule.

Slide over the stamper so it makes contact with the pollen

Twist and turn the capsule a few times, be gentle

Remove the capsule, note the pollen sticking to the stamper

Mark the flowers that have been pollinated with the relevant code / colour

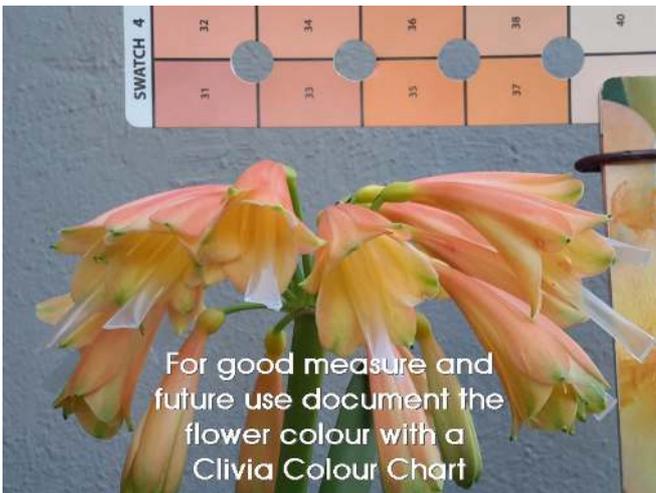

How we Pollinate our Clivia

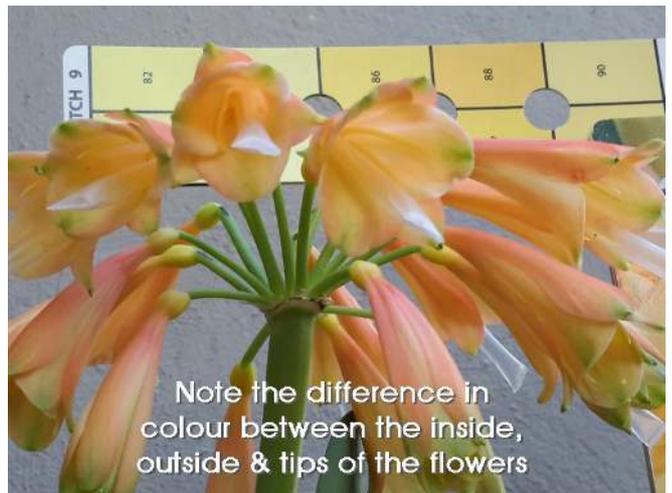

Cover the stamens with straws.
Multiple pollinations can be done
& are recommended

Repeat all steps until
all the flowers have
been pollinated.

For good measure and
future use document the
flower colour with a
Clivia Colour Chart

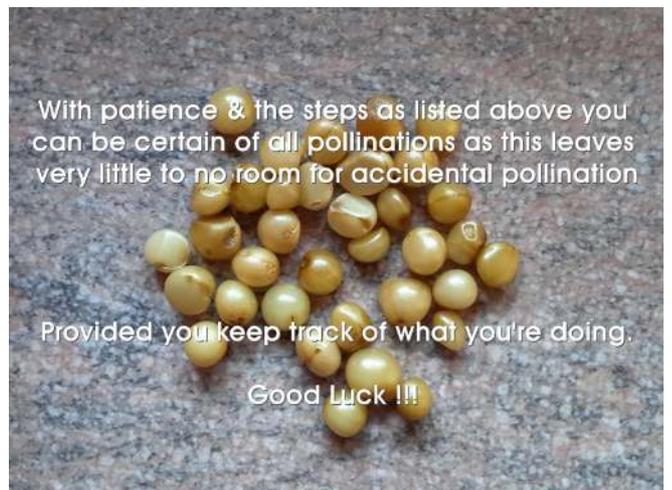

Note the difference in
colour between the inside,
outside & tips of the flowers

Pollinations are not always
100% successful.

Keep the plant well watered and
cool before during & after pollination.

Seed may take from 6 to 9
months to ripen depending on
the species.

With patience & the steps as listed above you
can be certain of all pollinations as this leaves
very little to no room for accidental pollination

Provided you keep track of what you're doing.

Good Luck !!!

Dragonfly Clivia

Cleaning, Germinating & Sowing Clivia Seed

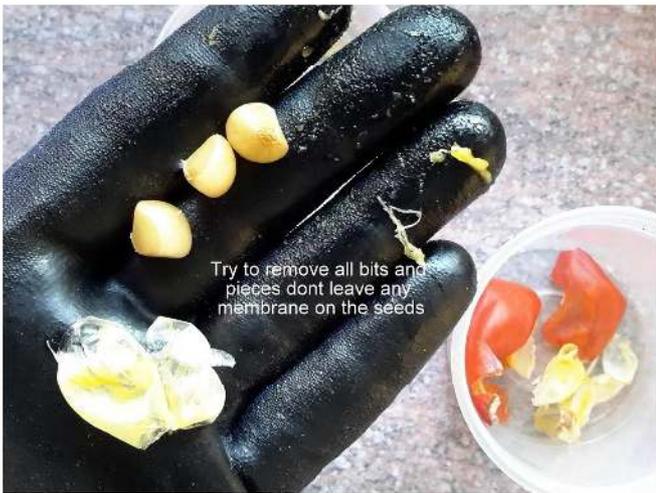

Dragonfly Clivia

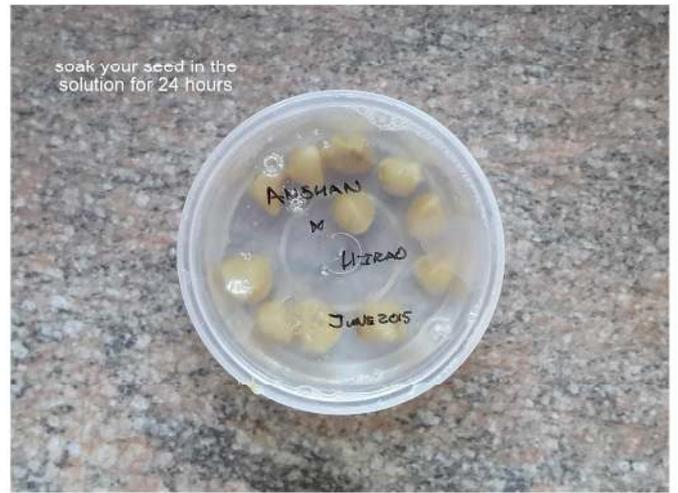

Cleaning, Germinating & Sowing Clivia Seed

remove each individual seed from the secondary membrane that encase them

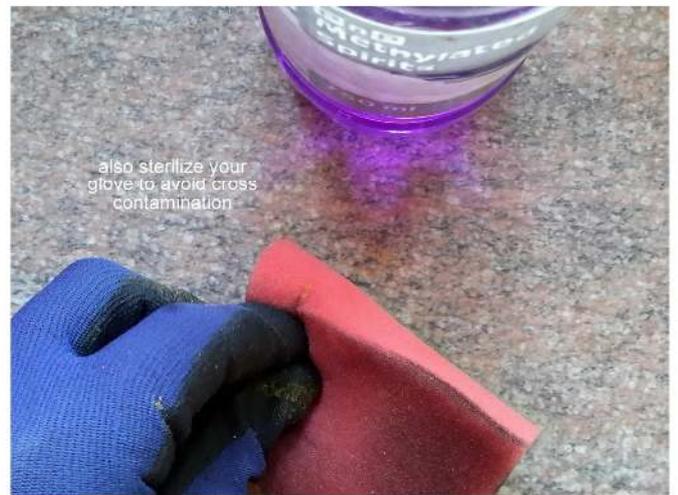

Try to remove all bits and pieces dont leave any membrane on the seeds

soak your seed in the solution for 24 hours

Sterilize all your equipment with the spirits before storage

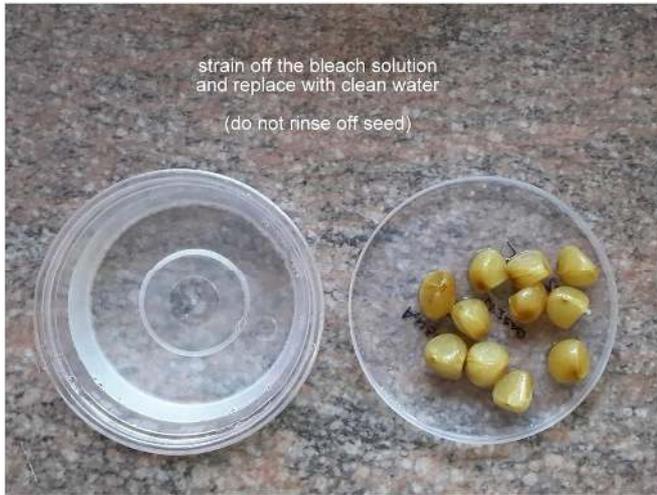

also sterilize your glove to avoid cross contamination

Dragonfly Clivia

Cleaning, Germinating & Sowing Clivia Seed

strain off the bleach solution and replace with clean water
(do not rinse off seed)

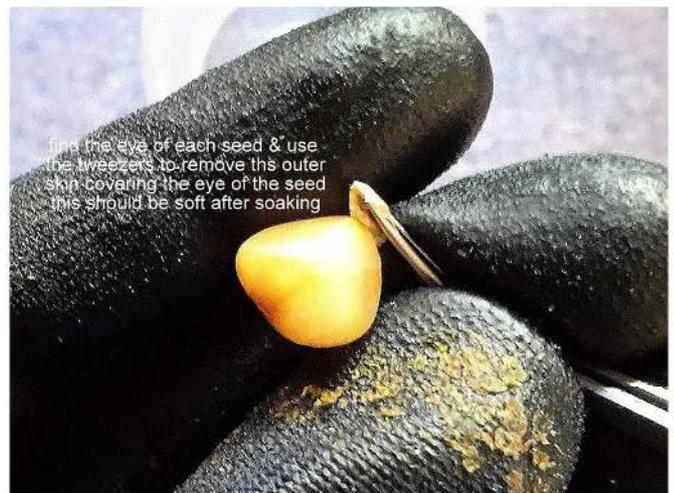

soak in water for another 24 hours

after soaking for 24 hours

replace water in container and remove seeds you will be looking for the eye of each seed for the next step

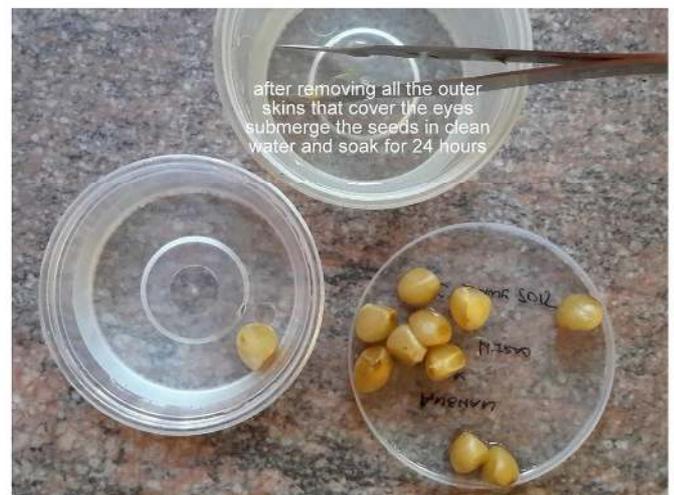

find the eye of each seed & use the tweezers to remove the outer skin covering the eye of the seed this should be soft after soaking

exposing the eye of the seed greatly increases germination rate and percentage

exposed eye

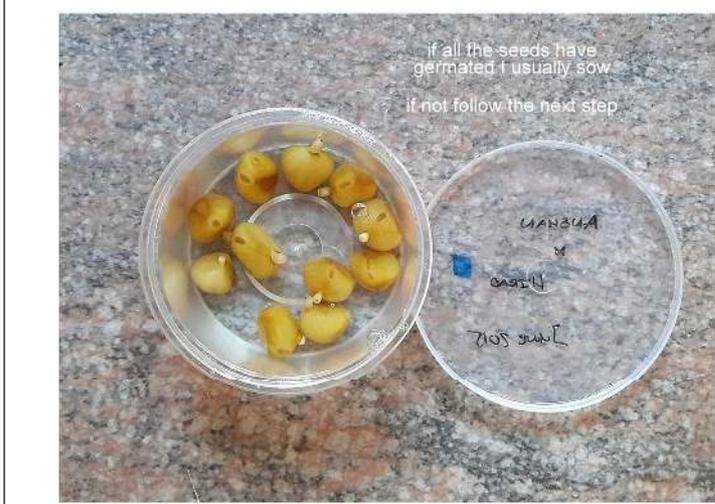

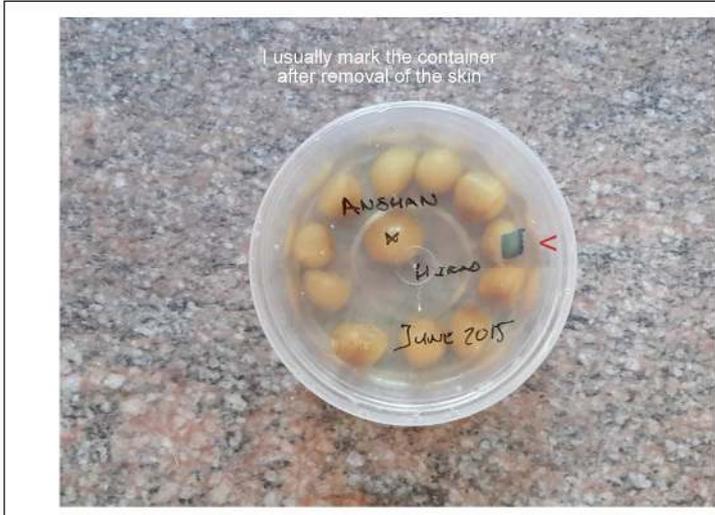

after removing all the outer skins that cover the eyes submerge the seeds in clean water and soak for 24 hours
