原子爆弾の爆発の閃光を爆心地近くにいた人は、黄赤色と感じ、遠くの場所にいた人は、マグネシウムの燃焼のような青白色に感じたと言われています。この火球から放射された強烈な熱線は、爆心地から半径3.5キロメートルまでの地域にいた人に火傷を負わせました。特に、1.2キロメートル以内にいた人は体の内部組織にまで大きな障害を受け、このため、数日のうちに死亡する人が続出しました。

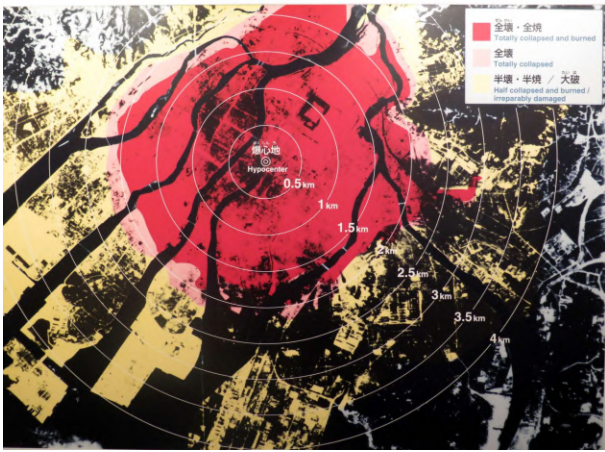

People close to the hypocenter said the atomic explosion looked yellowish red. Those farther away reported a bright bluish-white light resembling burning magnesium. The intense thermal rays from the fireball caused burns within a radius of up to 3.5 kilometers. Those within 1.2 kilometers of the hypocenter sustained severe injuries to their internal organs. Most died within a few days.
