## Section 2 – Compressor Diagnostic Readings

1. Remove compressor wires from contactor and run capacitor. Check the resistance of the compressor windings with the ohms function on a multi-meter. DO NOT use continuity function.

### SINGLE PHASE

C-R \_\_\_\_\_ Ohms

C-S \_\_\_\_\_ Ohms

S-R \_\_\_\_\_ Ohms

### THREE PHASE

T1 – T2 \_\_\_\_\_ Ohms

T2 – T3 \_\_\_\_\_ Ohms

T1 – T3 \_\_\_\_\_ Ohms

Single Phase: S-R should be highest, C-R should be lowest, C-R + C-S should equal S-R reading.

Three Phase: All three readings should be the same.

2. Remove wire harness from compressor terminals and perform resistance check again at compressor terminals.

### SINGLE PHASE

C-R \_\_\_\_\_ Ohms

C-S \_\_\_\_\_ Ohms

S-R \_\_\_\_\_ Ohms

### THREE PHASE

T1 – T2 \_\_\_\_\_ Ohms

T2 – T3 \_\_\_\_\_ Ohms

T1 – T3 \_\_\_\_\_ Ohms

Both sets of ohm readings should be the same.

3. Verify wiring per diagram

C to T1 or T2

R to T2 or T1

S to run capacitor HERM terminal

Capacitor COMMON to T2 or T1

4. Check run capacitor COM to HERM \_\_\_\_\_ MFD

5. Voltage check – from LOAD side of compressor contactor:

NO LOAD    L1 – L2 \_\_\_\_\_    L1 – L2 \_\_\_\_\_    L1 – L3 \_\_\_\_\_    L2 – L3 \_\_\_\_\_

UNDER LOAD    L1 – L2 \_\_\_\_\_    L1 – L2 \_\_\_\_\_    L1 – L3 \_\_\_\_\_    L2 – L3 \_\_\_\_\_

6. Current check – check while compressor is attempting to start.

C or T1 \_\_\_\_\_ AMPS

S or T2 \_\_\_\_\_ AMPS

R or T3 \_\_\_\_\_ AMPS

7. Line pressures:

LIQUID LINE \_\_\_\_\_ PSI

SUCTION LINE \_\_\_\_\_ PSI

Refrigerant charge in unit \_\_\_\_\_ LBS / OZ

Unit MOD: \_\_\_\_\_

Unit SER: \_\_\_\_\_

MAX FUSE SIZE listed on unit data plate: \_\_\_\_\_ AMPS

FUSE SIZE used in unit disconnect if applicable: \_\_\_\_\_ AMPS

Wire size feeding unit: \_\_\_\_\_

Length of wire run feeding unit: \_\_\_\_\_ FT

Voltage drop while start attempt should drop no more than 10%

If all previous steps check to be good, temporarily connect a start capacitor in parallel with the compressor run capacitor terminals COM and HERM.

Manually engage the compressor contactor for no more than 3 seconds. If compressor starts, remove power immediately and remove temporary start capacitor from circuit. Let pressures equalize and attempt to restart the compressor. If compressor does start and operate, take current readings and compare to unit data plate.

Attempt to restart equipment several times after pressures equalize. The equipment may require a permanent OEM hard start accessory.

If all previous steps check to be good and compressor will not start but is not drawing LRA that equals listing on unit data plate, the compressor wiring harness may be defective. Replace wire harness and attempt to operate compressor.
