

I am a junior at the University of Wisconsin-Madison majoring in Landscape Architecture (BLA), with certificates in Environmental Studies and Integrative Design of Built and Natural Environments. My interests focus on planting design, urban environments, and ecological systems, with a strong interest in how landscape architecture can respond to environmental challenges through both design and research.

My experience at UW-Madison has shaped how I approach complex problems and think across systems. Through my coursework, I have explored a wide range of topics, from soil structure and ecological processes to planting design and the integration of built and natural environments. This broad foundation has helped me develop a more thoughtful and adaptive design approach.

I am currently completing an independent research project that examines winter microclimate risk and access to shelter for people experiencing homelessness in Madison. Using spatial analysis and environmental data, this work focuses on how cold exposure varies across the city and how design and planning can better support vulnerable populations during extreme winter conditions.

This summer, I will be working as a landscape architecture intern with Snyder & Associates, where I look forward to gaining hands-on experience and continuing to develop my skills in practice.

Looking ahead, I hope to build a strong foundation in professional work before potentially pursuing a master's degree in landscape architecture or urban design. In the long term, I am interested in a career that stays connected to both practice and education.

Thank you again to the Garden Club of Greater Milwaukee for this generous scholarship.
