SIMPLIFIED DESIGN APPROACH

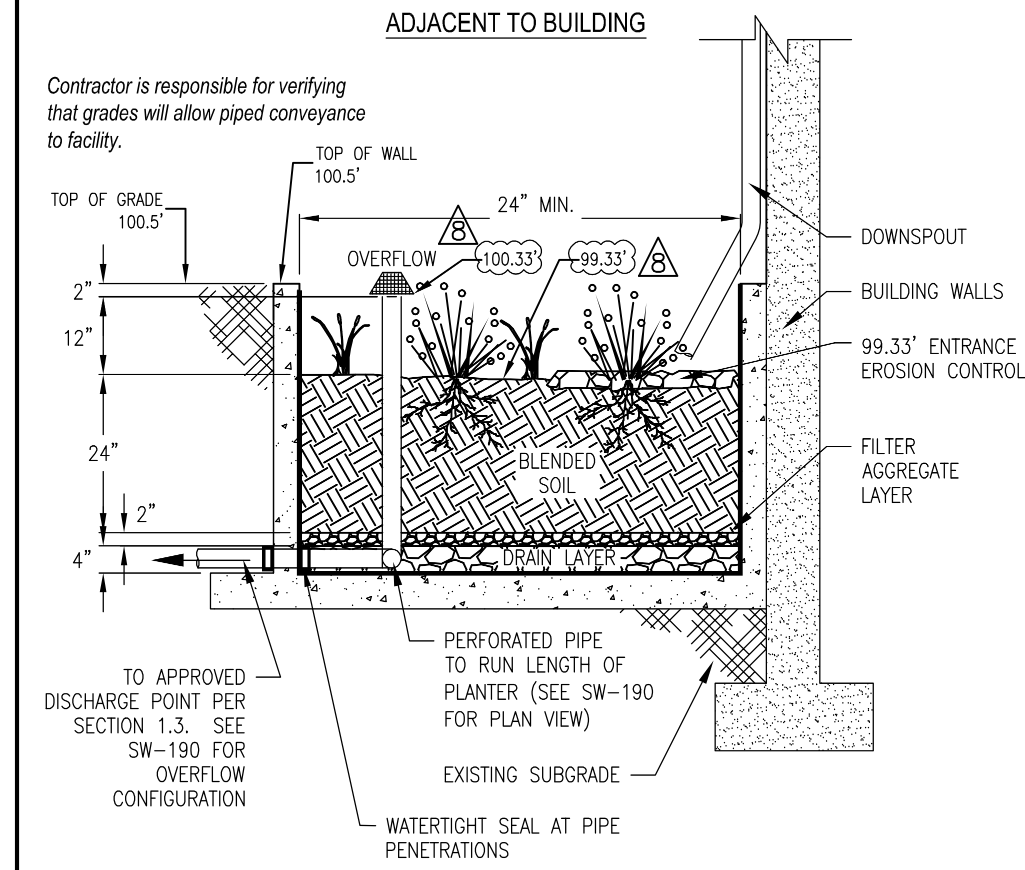
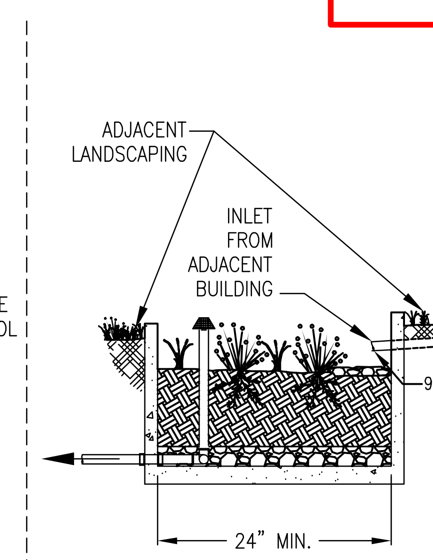
ADJACENT TO BUILDING



FREESTANDING PLANTER



1. Setbacks: No setback is required for lined planters. Walls can't exceed 30" height above grade if within 5' of property line including right-of-way.
2. Facility Slope (planted floor): Maximum of 0.5% in all directions.
3. Planter Structure: A single-pour monolithic concrete shell, without cold joints, is required to avoid the requirement for liner. Include walls on foundation plans. Check state structural standards for foundations.
4. Waterproofing: No additional waterproofing is needed if structure is monolithically poured.
5. Piping: Conform with Oregon Plumbing Specialty Code (OPSC) requirements.
6. Drain Layer: 4" of $\frac{3}{4}$"–1 $\frac{1}{2}$" washed drain rock. Filter aggregate layer: 2–3" of $\frac{1}{4}$"–No.10 washed angular aggregate.
7. Overflow: Overflow elevation must allow for 2" of freeboard, minimum. Protect from debris and sediment with strainer or grate.
8. Blended Soil: Use BES' standard soil blend for stormwater facilities (SWMM Section 6.3) unless otherwise approved. Install minimum of 24" of blended soil.
9. Vegetation: Refer to plant list in SWMM Section 3.5. Minimum container size is 1 gal. Number of plantings per 100sf of facility area: 80 herbaceous plants OR 72 herbaceous plants and 4 small shrubs.
10. Entrance Erosion Control: Install river rock, flagstone, or similar to dissipate the energy of incoming water at entrances and ends of downspout extensions.
11. Inspections: Call BDS IVR Inspection Line, (503) 823–7000, request 487. 3 inspections required.

CONSTRUCTION REQUIREMENTS
Do not allow temporary storage of construction waste or materials in the facilities. Do not allow entry of runoff or sediment during construction.

a. As allowed in section N1104.1, thermal performance2 of a component may be adjusted provided that overall heat loss does not exceed the total resulting from conformance to the required U–factor standards. Calculations to document equivalent heat loss shall be performed using the procedure and approved U–factors contained in Table N1104.1(1).
b. R–values used in this table are nominal for the insulation only in standard wood framed construction and not for the entire assembly.
c. Wall insulation requirements apply to all exterior wood framed, concrete or masonry walls that are above grade. This includes cripple walls & rim joist areas. Nominal compliance with R–21 insulation and Intermediate Framing (N1104.5.2) with insulated headers.
d. The wall component shall be a minimum solid log or timber wall thickness of 3.5 inches (90mm).
e. Below–grade wood, concrete or masonry walls include all walls that are below grade and do not include those portions of such wall that extend more than 24 inches (609.6mm) above grade. R–21 for insulation in framed cavity; R–15 continuous insulation.
f. Insulation levels for ceilings that have limited attic/rafter depth such as dormers, bay windows or similar architectural features totaling not more than 150 square feet (13.9 m²) in area may be reduced to not less than R–21. When reduced, the cavity shall be filled (except for required ventilation spaces). R–49 insulation installed to minimum 6–inches depth at top plate at exterior of structure to achieve U–factor.
g. Vaulted ceiling surface area exceeding 50 percent of the total heated space floor area shall have a U–factor no greater than U–0.026 (equivalent to R–38 rafter or scissor truss with R–38 advanced framing).
   ceiling with R–30 insulation is U–0.033 and complies with this requirement, not to exceed 50 percent of the total heated space floor area.
h. A=Advanced frame construction, See Section N1104.6.
i. Heated slab interior applies to concrete slab floors (both on and below grade) that incorporate a radiant heating system within the slab. Insulation shall be installed underneath the entire slab.
j. Sliding glass doors shall comply with window performance requirements. Windows exempt from testing in accordance with section NF1111.2, Item 3 shall comply with window performance requirements if constructed with thermal break aluminum or wood, or vinyl, or fiberglass frames and double–pane glazing with low–emissivity coatings of 0.10 or less. Buildings designed to incorporate passive solar elements may include glazing with a U–factor greater than 0.35 by using Table N1104.1(1) to demonstrate equivalence to building envelope requirements.
k. Reduced window area may not be used as a trade–off criterion for thermal performance of any component.
   Exception: Table N1101.1(2), Envelope Measure 6: calculation allows baseline case 15 percent of total wall area as window when design case utilizes window area of less than 15 percent.
l. Skylight area installed at 2% or less of total heated space floor area shall be deemed to satisfy this requirement with vinyl, wood, or thermally broken aluminum frames and double–pane glazing with low–emissivity coatings. Skylight U–factor is tested in the 20 degree (0.35rad) overhead plane in accordance with NFRC standards.
m. A maximum of 28 square feet (2.6m²) of exterior door area per dwelling unit can have a U–factor of 0.54 or less.
n. Glazing that is either double pane with low–e coating on one surface, or triple pane shall be deemed to comply with this U–0.30 requirement.

from Table N1101.1(1): (WALL INSULATION–ABOVE GRADE, R–21 INTERMEDIATE [c])

N.1104.5.2 Intermediate framing for walls. Intermediate framing for walls is an optional construction method. Intermediate framing, when used to achieve improved wall performance under the requirements of Table 1101.1(1) or Table N1104.1(2), shall meet the following requirements:

1. **Walls**. Walls shall be formed with 2x studs at 16 inches (610 mm) on center and shall include the following, as detailed in Items 2 and 3.

2. **Corners and intersections**. Exterior wall and ceiling corners shall be fully insulated through the use of three–stud corners configured to allow full insulation into the corner, or two–stud corners and drywall backup clips or other approved technique. Intersections of interior partition walls with exterior walls shall be fully insulated through the use of single backer boards, mid–height blocking with drywall clips or other approved technique.

3. **Headers**. Voids in headers 1 inch (25.4 mm) or greater in thickness shall be insulated with rigid insulation that has a value of R–4 or greater per 1 inch (25.4mm) thickness. Nonstructural headers (such as in gable end walls) can be eliminated and replaced with insulation to achieve equivalent levels as the surrounding area.
