

# How to change DNS on a MAG device

We're about to guide you to use this method to bypass to restriction of your ISP accessing IPTV servers.

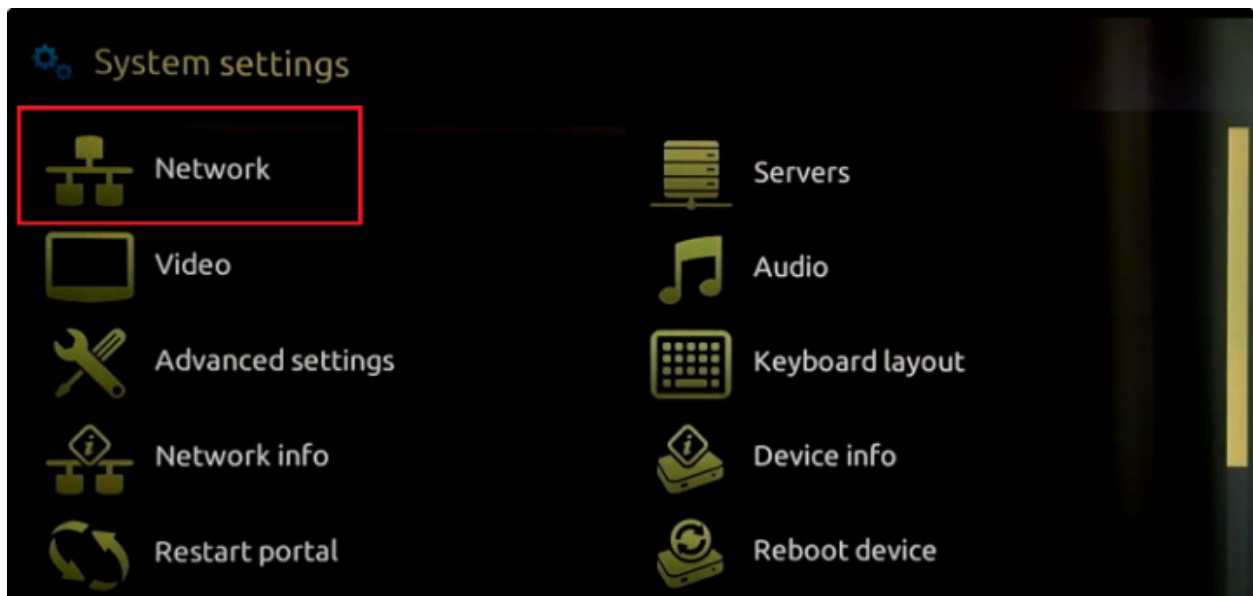

## Before getting start

Before you change to any DNS addresses, make sure you write down your current DNS address so you can keep these numbers in case you need to get back to your original settings. [Step 3]

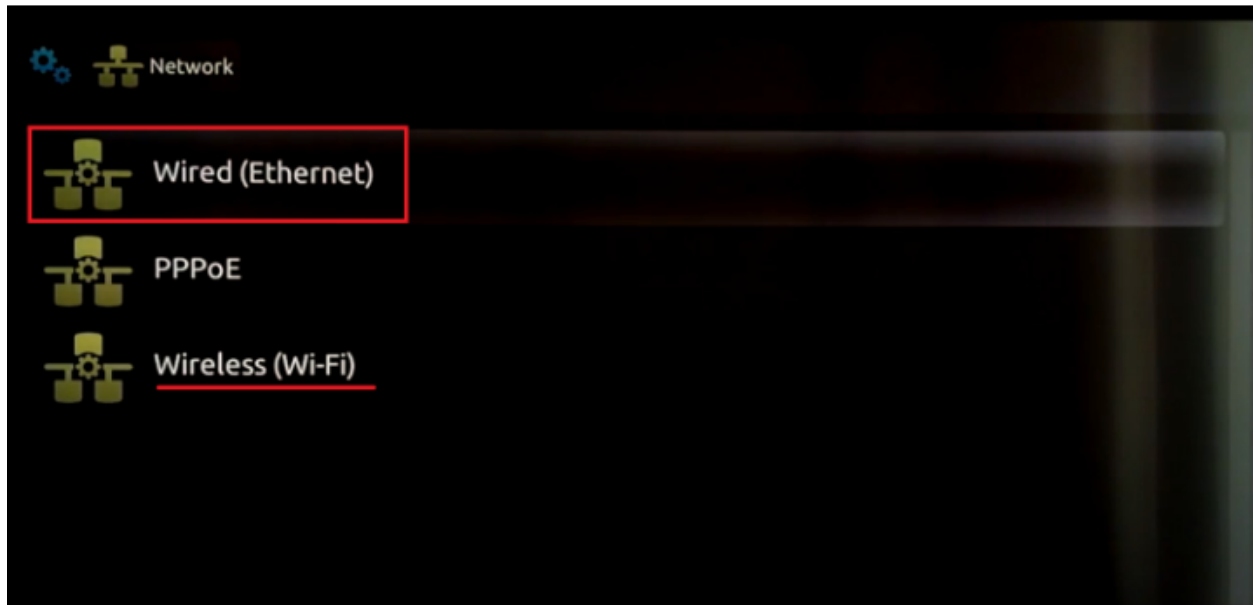

Note: If your original settings were set to "Automatic", just change your DNS settings back to "Automatic".

In order to go to the inner portal of the mag device, just turn off your Wi-Fi internet or if you are using the Ethernet cable leave it disconnect. Now if you reboot the mag device, after reboot, it will stop in "page loading error". From here you can choose "System Settings".

Step 1: Go to "Settings". And find the "System Settings" find the "Network" Tab and click on it.

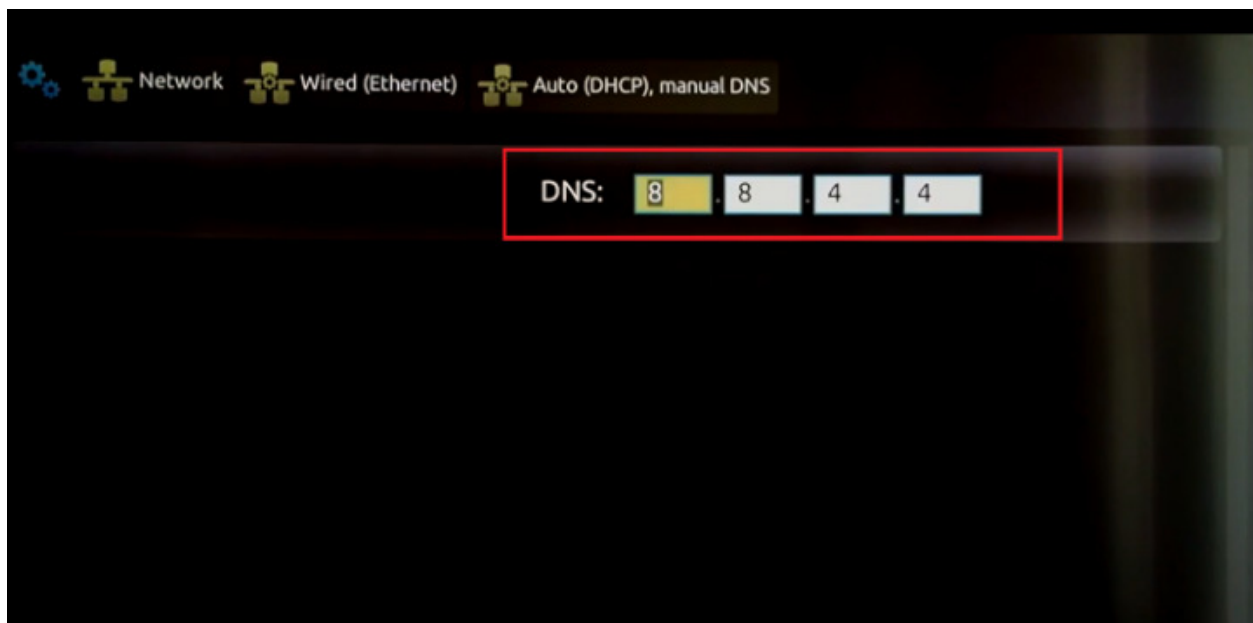

Step 2: Click on “Wired Ethernet” if you device is connected by wire [In this tutorial we covered the Wired one, the syntax is the same for the wireless]. Click on “Wireless (Wi-Fi)” If you’re connected by Wireless.

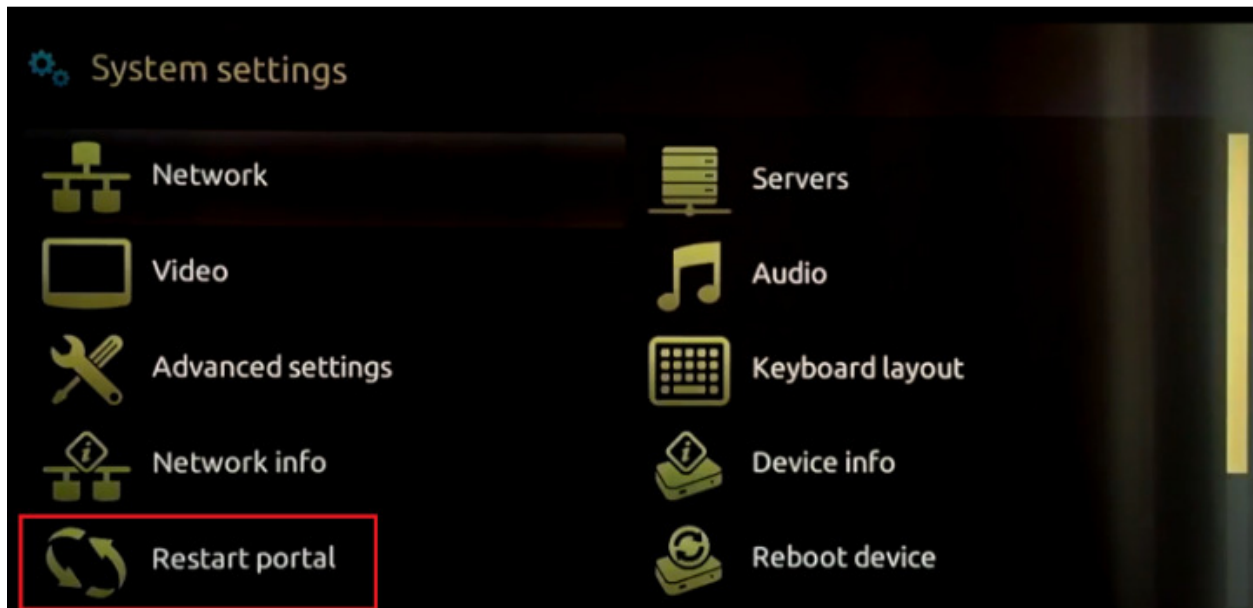

Step 3: In the next tab find the “Auto (DHCP), manual DNS” and click on it. Now, try to test with the below DNS

Google DNS [We used for this tutorial]: **8.8.4.4** and **8.8.8.8**  
Open DNS: **208.67.222.222** and **208.67.220.220**  
Cloudflare DNS: **1.1.1.1** and **1.0.0.1**

Step 5: Once set, press the back button & “**Restart the portal**” as shown below & you’re done!

Thanks.
