

MMW-3

Environmental Toxins

The capacity to transmute upon a molecular and biological level is not new information. It is ancient information and also is related to ascension. Asur'Ana and Per have transmuted over 1400 toxic substances recorded in their DNA in their ascensions to date. To accomplish this, the immune system creates a counter substance to address the toxin. As the counter substance is blended with the toxin, the toxin is transmuted into something inert, and sometimes into something helpful to the continued ascent. Many in our DAS study programs have transmuted hundreds of toxic substances also in parallel and as an immune system response through ascension.

There are records of biological warfare from the time of Atlantis and the Anu alike, and often the substances that recur through ascension are related to these time periods in human genetic history. As they are transmuted, so is the thoughtform associated which is often fear based, as this is what toxins upon a biochemical level create, toxins create the emotional experience of fear in the dance of life.

Regeneration and Love Transmuting

Regenerative thoughtform is a loving state of existence. Love flows through the heart of the energy flow of the regenerative chakra system and subtle bodies of the crystalline form and blesses all parts of the field day and night. Love flows through also as blessings unto everything one touches in a regenerative energy flow; for it is not just the biology that shifts in the ascension towards crystalline biology; but also, the energetic dynamics surrounding one's form. As the energy sustains a state of love, one is considered mastered over Bodhisattva level evolution. Terra last year mastered Bodhisattva level as a global vessel; and there is a state of love now flowing through her field and beginning to foster her own self-healing within.

Love allows for the transformation of the molecules out of destructive biological systems and into systems that support and sustain life. How exactly does this occur? One can think of love as the transformative ingredient that shortens the molecular chain of any substance of the biology that are non-resonant. As love hits a molecular structure that is dissonant, it will vibrate the structure apart so that it breaks into two or breaks off a molecule or two, rendering it inert. Then what is created in the transmutation can be assessed again out of the love to be recreated anew into a useful substance unto the biology.
