CALL OR TEXT

Q: Do I need to do anything during a freeze?

Your pools freeze-protection system will automatically turn on when temperatures drop. If you do NOT have freeze protection, your system must be running 24/7 during freezing weather to prevent damage.

Q: Should I turn my pump off?

No — never turn your pump off during freezing temperatures. **Flowing water** is what protects your pipes and equipment from freezing and bursting.

Q: What is freeze protection?

Freeze protection is a built-in feature on many pool systems that automatically turns your pump on when air temperatures reach around 36–38°F.

Q: How long should my pump run during a freeze?

Ideally, 24 hours during hard freezes. At minimum, it should run overnight and during the coldest hours.

Q: What if my power goes out?

If power is out and temps are below freezing:

- Shut off power to the equipment
- Open all pump and filter drain plugs
- Remove any rubber drain caps
- Open air relief valves on filters
- This allows water to drain and prevents cracking.

Extra Freeze Tips for Pool Owners

- Cover exposed pipes and valves: If you have above-ground or exposed plumbing, wrap it with towels, foam pipe insulation, or blankets. ****Not required but recommended if you lose power****
- Take a quick look after dark to confirm your pump is running during the coldest hours.
- If your equipment is in an enclosure, keep doors closed to trap warmer air.
- **Clear skimmers and baskets: Make sure baskets are empty so water can flow freely during a freeze.**
- Watch for unusual sounds: Grinding, whining, or air sucking noises during freeze conditions mean something's wrong—shut it down and call us.
- Don't chip ice off equipment: If you see ice forming, do not hit or chip it. Let it melt naturally.
- Know where your breaker is: In emergencies, you may need to shut off power quickly before draining equipment.
- Your heater does not need to come on during a freeze protection!

FLOWING WATER IS THE BEST WAY TO PROTECT YOUR POOL SYSTEM AND EQUIPMENT!
