
High Yield Strength Deformed Bars

NOTES :-

1. The design is according to the following Bridge Codes (i) IRC : 5-1970., (ii) IRC : 6-1966 & (iii) IRC : 21-1972
2. This drawing is applicable for Square Crossings
3. All dimensions are in millimetres
4. Concrete shall have a minimum 28 days works cube strength of 200 kg/cm on 150 mm cubes
5. Reinforcing steel used shall be High Yield Strength Deformed Bars conforming to I.S. 432-1966 (with amendment No. 1 of August, 1968 and amendment No 2 of November, 1970) or I.S. 1786 - 1966 (with amendment No. 1 of August, 1968 and amendment No 2 of December, 1970).
6. Minimum cover to any reinforcement shall be 25 mm unless shown otherwise in the drawing.
7. Joints or lapping of bars shall be suitably staggered as per clause 304.6.3 of IRC : 21-1972.
8. Full scale elevation for the bars shall be laid out on a plane platform floor to the dimensions shown on the drawing so as to get correct clearance between the different bars and then the bars bent up to proper shape.
9. The railings shall be of any approved type. The
14. Footpath slabs may be provided with a wearing course of precast chequered tiles fixed firmly and true to levels.
15. For schedule of reinforcement, quantities and reactions Drg. No. BD/6-74 may be referred to.
16. This drawing shall not be used in unfavourable conditions of exposure such as marine atmosphere etc., unless approved measures are taken to protect the reinforcement from corrosion.

PREFACE TO SECOND EDITION

Subsequent to the publication of first edition of this volume, some of the standard drawings for Reinforced concrete solid slab bridges had to be revised on account of revision of Ministry's standard drawing No. BD/1-69 for wearing coat and drainage spouts. In the revised drawings for slab bridges, the specifications of expansion joint have also been modified. The second edition contains the revised drawings. Further, in order to make this volume self-contained, drawing No. BD/1-69A showing revised details of wearing coat and drainage spouts has also been added.

New Delhi, March 10, 1983

G. VENKATESULU
Additional Director General (Bridges)

PREFACE TO FIRST EDITION

Standard Plans for Highway Bridges with R.C.C. Superstructure using mild steel round bars as reinforcement (Vol. I) was issued during 1973 by the Roads Wing.

With the introduction of High Yield Strength Deformed bars and the production of mild steel bars being phased out from the market, the demand for standard designs adopting High Yield Strength Deformed bars has become urgent. The preparation of standard designs was, therefore, taken up on a priority basis so that High Yield Strength Deformed bars could be used on a wider scale. M/s Tor-Steel Research Foundation in India helped in the computation of the design for solid slab bridges for square crossings.

This volume (Vol. II), the first in the series using High Yield Strength Deformed bars, contains standard plans for highway solid slab bridges. It also contains standard plans for R.C.C. piers suitable to carry the slab superstructure.

The plans have been evolved for two lanes of traffic with a carriageway width of 7.5 metre with and without footpath of 1.5 metre on either side and designed for one-lane of IRC Class 70-R wheeled or tracked vehicle or two lanes of Class 'A' vehicles. For decks-with-footpaths, the intensity of footpath loading has been assumed as 400 kg per square metre. The designs are based on the Standard Specifications and Codes of Practice for Road Bridges issued by the Indian Roads Congress. For construction purposes, Specifications for Road and Bridge Works issued by the Ministry of Shipping & Transport (Roads Wing) shall be followed. For convenience of estimation, a summary of details and quantities of different materials has also been given in Tables 1 to 5.

The plans have been made complete in all respects as far as possible so that they could be readily adopted in the field and also serve as contract drawings. I hope this publication will go a long way in maximising the use of high yield strength deformed bars and at the same time effecting economy in the construction of our slab bridges.

J.S. MARYA
Director General (Road Development) & Addl.
Secretary to the Govt. of India

High Yield Strength Deformed Bars

NOTES :-

1. The design is according to the following Bridge Codes :- (i) IRC : 5-1970, (ii) IRC : 6-1966 & (iii) IRC : 21-1972.
2. This drawing is applicable for Square Crossings.
3. All dimensions are in millimetres.
4. Concrete shall have a minimum 28 days works cube strength of 200 kg/cm^2 on 150mm cubes.
5. Reinforcing steel used shall be High Yield Strength Deformed Bars conforming to I.S. 1139 - 1966 (with amendment No. 1 of August, 1968 and amendment No. 2 of November, 1970) or I.S. 1786-1966 (with amendment No. 1 of August, 1968 and amendment No. 2 of December, 1970)
6. Minimum cover to any reinforcement shall be 25 mm unless shown otherwise in the drawing.
7. Joints or lapping of bars shall be suitably staggered as per clause 304.6.3 of IRC : 21-1972. This drawing is not applicable for welded joints.
8. Full scale elevation for the bars shall be lined out on a plane plastered floor to the dimensions shown on the drawing so as to get correct clearance between the different bars and then the bars bent up to proper shape.
9. The railings shall be of any approved type. The reinforcement from railings should be incorporated in the kerb before casting the slab. (Ref. BD-5-69 SD-159)
10. No provision for drainage has been made in this drawing. If required, drawing No. BD/1-69 may be referred to
11. Precast mortar blocks of the same strength as the slab concrete, shall be used under the reinforcement to ensure the required cover.
12. Properly braced steel plates shall be used as shuttering.
13. For schedule of reinforcement, quantities and reactions Drg. No. BD/2-74 may be referred to.
14. This drawing shall not be used in unfavourable conditions of exposure such as marine atmosphere etc., unless approved measures are taken to protect the reinforcement from corrosion.

High Yield Strength Deformed Bars

NOTES :-

1. The design is according to the following Bridge Codes: (i) IRC : 5-1970, (ii) IRC : 6-1966 & (iii) IRC : 21-1972.
2. This drawing is applicable for Square Crossings.
3. All dimensions are in millimetres
4. Concrete shall have a minimum 28 days works cube strength of 200 kg./cm^2 on 150 mm cubes.
5. Reinforcing steel used shall be High Yield Strength Deformed Bars conforming to I.S. 1139-1966 (with amendment No. 1 of August, 1968 and amendment No. 2 of November, 1970) or I.S. 1786-1966 (with amendment No. 1 of August, 1968 and amendment No. 2 of December, 1970).
6. Minimum cover to any reinforcement shall be 25 mm unless shown otherwise in the drawing.
7. Joints or lapping of bars shall be suitably staggered as per clause 304.6.3 of IRC : 21-1972. This drawing is not applicable for welded joints.
8. Full scale elevation for the bars shall be lined out on a plane plastered floor to the dimensions shown on the drawing so as to get correct clearance between the different bars and then the bars bent up to proper shape.
9. The railings shall be of any approved type. The reinforcement from railings should be incorporated in the kerb before casting the slab.
10. No provision for drainage has been made in this drawing. If required, drawing No. BD/1-69 may be referred to.
11. Precast mortar blocks of the same strength as the slab concrete, shall be used under the reinforcement to ensure the required cover.
12. Properly braced steel plates shall be used as shuttering
13. For schedule of reinforcement, quantities and reactions Drg. No. BD/4-74 may be referred to.
14. This drawing shall not be used in unfavourable conditions of exposure such as marine atmosphere etc., unless approved measures are taken to protect the reinforcement from corrosion.

NOTES:

1. This drawing shall be read in conjunction with Drawing No. BD/7-74 showing the details of R.C.C. deck slab.
2. The schedule of reinforcement is based on bearing width of 370 mm. In case of increase in bearing width, the schedule of reinforcement shall be modified suitably.
3. The width of each panel of pre-cast footpath slab may be such as to facilitate easy handling. The width shown in this Drawing is not binding.

High Yield Strength Deformed Bars

NOTES :

1. The design is according to the following Bridge Codes - (i) IRC : 5-1970, (ii) IRC : 6-1966 & (iii) IRC 21-1972
2. This drawing is applicable for Skew Bridges with angles of skew 15° to 60°. For any intermediate angle of skew between those given in the reinforcement table, spacing of bars can be linearly interpolated
3. For skew angles less than 15° the moment may be calculated for a right bridge of span centre to centre of supports, measured parallel to centre line of road-way. Main reinforcement may be provided in a direction parallel to traffic and transverse reinforcement parallel to abutment.
4. All dimensions are in millimetres.
5. Concrete shall have a minimum 28 days works cube-strength of 200 kg./cm² on 150 mm cubes.
7. Reinforcing steel used shall be High Yield Strength Deformed Bars conforming to I.S. 1139-1966 (with amendment No. 1 of August, 1968 and amendment No. 2 of November, 1970) or I.S. 1786-1966. (with amendment No. 1 of August, 1968 amendment No. 2 of December, 1970).
7. Minimum cover to any reinforcement shall be 25 mm unless otherwise shown in the drawing.
8. Joints or lapping of bars shall be suitably staggered as per clause 304.6.3 of IRC : 21-1972. This drawing is not applicable for welded joints.
9. The railings shall be of any approved type. The reinforcement from railing should be incorporated in the kerb before casting the slab.
10. For the details of drainage, Drawing No. BD/1-69 may be referred to.
11. Pre-cast mortar blocks of the same strength as the slab concrete shall be used under the reinforcement to ensure the required cover.
12. Properly braced steel plates shall be used as shuttering.
13. Top surface of the pre-cast footpath slab shall be clearly marked for proper handling to avoid cracking
14. Footpath slab may be provided with a wearing course of pre-cast chequered tiles fixed firmly and true to levels.
15. For schedule of reinforcement and quantities Drawing No. BD/11-74 may be referred to.
16. This drawing shall not be used in unfavourable conditions of exposure such as marine atmosphere etc. unless approved measurs are taken to protect the reinforcement from corrosion.

NOTES :-

1. The design is according to the following Bridge Codes: (i) IRC : 5 - 1970, (ii) IRC : 6 - 1966 & (iii) IRC : 21 - 1972.
2. This drawing is applicable for Skew Bridges with angles of skew 15° to 60°. For any intermediate angle of skew between those given in the reinforcement table, spacing of bars can be linearly interpolated.
3. For skew angles less than 15° bending moment may be calculated for a right bridge of span centre to centre of supports, measured parallel to centre line of roadway. Main reinforcement may be provided in a direction parallel to traffic and transverse reinforcement parallel to abutment
4. All dimensions are in millimetres.
5. Concrete shall have a minimum 28 days works crushing strength of 200 kg/cm² on 150 mm cubes.
6. Reinforcing steel used shall be High Yield Strength Deformed Bars conforming to I.S. 1139 - 1966 (with amendment No. 1 of August, 1968 and amendment No. 2 of November, 1970) or I.S. 1786 - 1966 (with amendment No. 1 of August, 1968 and amendment No. 2 of December, 1970).
7. Minimum cover to any reinforcement shall be 25 mm unless otherwise shown in the drawing.
8. Joints or lapping of bars shall be suitably staggered as per clause 304.6.3. of IRC : 21 - 1972. This drawing is not applicable for welded joints.
9. The railings shall be of any approved type. The reinforcement from railing should be incorporated in the kerb before casting the slab.
10. No provision for drainage has been made in this drawing. If required, Drawing No. BD/1-69 may be referred to.
11. Pre-cast mortar blocks of the same strength as the slab concrete shall be used under the reinforcement to ensure the required cover
12. Properly braced steel plates shall be used as shuttering.
13. For schedule of reinforcement and quantities Drawing No. BD/13-74 may be referred to
14. This drawing shall not be used in unfavourable conditions of exposure such as marine atmosphere etc. unless approved measures are taken to protect the reinforcement from corrosion.

NOTES :-

1. This drawing shall be read in conjunction with Drawing No. BD/19-74 showing the details of R.C.C. Skew Slabs.
2. The schedule of reinforcement is based on bearing width of 370 mm. In case of increase in bearing width the schedule of reinforcement shall be modified suitably.
3. Full scale elevation for the bars shall be lined out on a plane plastered floor to the dimensions shown on the drawing so as to get correct clearance between the different bars and then the bars bent up to proper shape.

SECTIONS THROUGH PIER CAP
(PIER CAP REINFORCEMENT ONLY)

NOTES :-

1. The pier cap and pier are designed to support solid slab right bridges without footpaths issued vide Drg. No. BD/1-74 and BD/3-74.
2. The designs are based on the provisions contained in the I.R.C. Bridge Codes (i) I.R.C. 5-1970 (ii) I.R.C. 6-1966 and (iii) I.R.C. 21-1972 and sound engineering practice.
3. Concrete shall have a minimum 28 day's works cube strength of 200 kg/cm² on 150 mm cubes.
4. Reinforcing steel used shall be High Yield Strength Deformed Bars conforming to I.S. 1786-1966 (with amendment No. 1 of August, 1968 and amendment No. 2 of December, 1970) or I.S. 1139-1966 (with amendments of August, 1968 and November, 1970).
5. The design has been checked and found safe for a seismic force of G/10 taken as per clause 222 of I.R.C. 6-1966.
6. The shuttering of the span cast shall only be removed after the adjacent span is also cast or otherwise the pier shall be duly supported with stays on both sides.
7. Co-efficient of friction at the bearing surface (concrete to concrete) has been taken as 0.6 for designs. The top of pier cap shall be rubbed smooth with carborundum stone.
8. All dimensions are in millimetres.
9. Minimum cover to main steel reinforcement in the pier cap and pier shall be 40 mm. Cover to other reinforcement shall not be less than 25 mm.
10. Joints or lapping of bars shall be suitably staggered as per clause 304.6.3. of I.R.C. 21-1972.
11. Full scale elevation for the bars shall be lined out on a planed plastered floor to the dimensions shown on the drawing so as to get correct clearance between the different bars and then the bars bent to proper shape.
12. For dimensions, schedule of reinforcement and quantities Drg. No. BD/9-75 may be referred to.
13. The design shall not be used in unfavourable conditions of exposure such as marine atmosphere etc. unless approved measures are taken to protect the reinforcement from corrosion.
14. Kerb, Wearing Coat and Railings shall be cast after the adjacent span is cast.

DIMENSIONS

Effective span of slab (respective) (m)	Depth of pier cap 'A' (mm)	Width of pier 'E' (mm)	Straight height of pier 'D' (mm)	Cantilever length of pier cap 'C' (mm)
3.37	770	300	3450	2025
4.37	830	400	3350	2075
5.37	920	500	3250	2125
6.37	1000	600	3150	2175
7.37	800	700	3050	2225
8.37	1150	700	3050	2225
9.37	1250	800	2950	2275
10.37	1300	800	2950	2275

NOTES :-

1. The details given in this drawing may be read in conjunction with Drawing No. BD/8-75.
2. Schedule of reinforcement are given as per I.S. 2502-1963.
3. For intermediate heights, the area of reinforcement required may be interpolated from the schedule of reinforcement.
4. Loads and moments at base of pier have not been given since the critical values for each case of foundation design may differ from that of pier.

SECTION THROUGH PIER CAP
(PIER CAP REINFORCEMENT ONLY)

NOTES :-

1. The pier cap and pier are designed to support solid slab right bridges with footpaths issued vide Drg No BD/5-74 and BD/7-74.
2. For dimensions of pier and pier cap, schedule of reinforcement and quantities Drg. No. BD/11-75 may be referred to.
3. The designs are based on I.R.C. Bridge Codes (i) I.R.C. 5-1970, (ii) I.R.C. 6-1966 & (iii) I.R.C. 21-1972 and sound engineering practice.
4. The design has been checked for a seismic force of g/10.
5. Coefficient of friction at the bearing surface (concrete to concrete) has been taken as 0.6 for designs. The top of pier cap shall be rubbed smooth with carborundum stone.
6. Concrete shall have a minimum 28 day's works crushing strength of 200 kg/cm² on 150 mm cubes.
7. Reinforcing steel used shall be High Yield Strength Deformed Bars conforming to I.S. 1786-1966 (with amendment No. 1 of August, 1968 and amendment No. 2 of December, 1970) or I.S. 1139-1966 (with amendments of August, 1968 and November, 1970)
8. Minimum cover to main steel reinforcement in the pier cap and pier shall be 40 mm. Cover to other reinforcement shall not be less than 25 mm.
9. Joints or lapping of bars shall be suitably staggered as per clause 304.6.3 of I.R.C. 21-1972.
10. The shuttering of the span cast shall only be removed after the adjacent span is also cast or otherwise the pier shall be duly supported on both sides.
11. Kerb, Wearing coat and Railings shall be cast after the adjacent span is cast.
12. Full scale elevation for the bars shall be lined out on a plane plastered floor to the dimensions shown on the drawing so as to bend the bars to proper shape.
13. All dimensions are in millimetres.
14. This drawing shall not be used in unfavourable conditions of exposure such as marine atmosphere etc. unless approved measures are taken to protect the reinforcement from corrosion.

NOTES

1. The details shown in this drawing are applicable for two lane highway bridges with level decks.
2. All dimensions are in millimetres.
3. Material specifications and workman ship shall be in accordance with Ministry's specification for road and bridge works unless stated otherwise in this drawing.
4. Reinforced concrete wearing coat :-
   (i) Wearing coat shall be bonded type.
   (ii) Concrete mix shall be of M 300 grade with cement content not less than 350 kg/m^3 and water cement ratio not more than 0.4.
   (iii) Reinforcement shall be placed in the middle of wearing coat.
   (iv) Spacing of reinforcement shall be reduced to 100mm in either direction over a strip of 300mm near the expansion joints.
   (v) Joints in the wearing coat may be avoided as far as possible. Reinforcement shall however, be continued across the joints, if provided.
5. Expansion joint details shown in this drawing are applicable for R.C.T-Beam and slab type bridge super structures as per Ministry's standard plans.
6. Drainage spout shall be galvanised after welding the plates and flats together.
7. Grating shall not be provided under footpath slab. 75 mm dia. drainage pipe shall only be used.
8. Spacing of drainage spout shall not exceed 10 metres.

FOREWORD

I am extremely happy to place before the community of Bridge Design and Construction Engineers the Standard Plans for Highway Bridges Vol. III Concrete T-Beam Bridges, which have been finalised in the Ministry of Shipping & Transport (Roads Wing) over the past few years. This publication second in the series of standard plans using high yield strength deformed bars, alongwith the previous Vol. II containing Standard Plans for concrete slab bridges published earlier, will prove to be quite useful in the proper planning, estimation and execution of most of the medium and minor Highway bridges which constitute the bulk of the total number of bridges being built in our country.

The publication has been made possible by the combined efforts of the officers and staff working in the Bridge Standard Zone of this Ministry who deserve commendation for the efforts made by them. The keen interest taken by Addl. Director General (Bridges) in bringing out this publication, but for which it would have taken a little more time, is also highly appreciated.

J.S. MARYA
Director General (Road Development) & Addl. Secretary to the Govt. of India

New Delhi, Oct. 1, 1980

PREFACE

Standard Plans (Vol. I) for Highway Bridges with RCC superstructure using mild steel round bars as reinforcement were issued during 1973 by the Roads Wing.

With the introduction of high yield strength deformed bars and the production of mild steel bars being phased out from the market, the demand for standard design adopting high yield strength deformed bars became urgent. The preparation of standard designs was, therefore, taken up on a priority basis so that high yield strength deformed bars could be used on a wider scale.

The Volume II, the first in the series using high yield strength deformed bars, was issued in 1977. It contained standard plans for solid slab type highway bridges and RCC piers suitable to carry the slab superstructure.

This Volume (Vol. III), the second in the series using high yield strength deformed bars, contains standard plans for RCC T-beam Highway bridge superstructures for effective spans of 10.5, 12.5, 14.5, 16.5, 18.75, 21.75, and 24.75 metres. It also contains drawings for elastomeric bearings and connection of approaches to highway bridges. It may be worthwhile to mention that the beam sections have been so proportioned that they permit the use of modular shuttering which could be repeated for other spans. In order to get good finish, compaction and quality in the adoption of these standard designs, rigid steel shuttering made of steel plates of thickness of not less than 5 to 6 mm needs to be used and supported by un-yielding centering with steel pipes joined firmly to proper profile. These modular moulds and centering for these standard designs could be acquired by department and issued to contractors for economy.

The plans have been evolved for two lanes of traffic with a carriageway width of 7.5 metres without and with footpaths of 1.5 metres each on either side and designed for one-lane of IRC Class 70-R wheeled or tracked vehicle or two-lanes of Class 'A' vehicle. For decks with footpaths, the intensity of footpath loading has been assumed as 400 kg per square metre. The designs are based on the Standard Specifications and Codes of Practice for Highway Bridges issued by the Indian Roads Congress. For construction purposes, Specifications for Road and Bridge Works issued by the Govt. of India, Ministry of Shipping & Transport (Roads Wing) and as amended from time to time shall be followed. For convenience of estimation, a summary of details of quantities of different materials has also been given.

The plans have been made complete in all respects as far as possible so that they could be readily adopted in the field and also serve as contract drawings. I hope this publication will go a long way in maximising the use of high yield strength deformed bars and at the same time affecting economy and quality in the construction of our highway bridges.

Every possible care has been taken to eliminate errors in the drawings and tables, but errors or omissions, if any, found by the users and brought to our notice will be highly appreciated. Any suggestions for the improvement of this publication will also be most welcome.

The preparation of the standard designs in the present shape goes to the credit of several officers of this Ministry whose names appear in the title blocks of various drawings. Their contribution is gratefully acknowledged.

Thanks are also due to S/Shri D.P. Tiwari, N.D. Dua, S K. Mallick, M.N. Bhatt and Kanti Chander D/men in this Ministry of their diligence in the preparation of drawings.

The contribution of M/s Torsteg Research Foundation in India for their help in the preparation of some of the designs is thankfully acknowledged.

B. BALWANT RAO
Addl. Director General (Bridges), Ministry of Shipping & Transport (Roads Wing)

New Delhi, Oct. 1, 1980

MESH REINFORCEMENT 6 mm

NOTES :-

1. For general notes refer Drawing No. BD/1 - 75A
2. Clear cover shall not be less than 40 mm for main reinforcement and 25 mm for other reinforcement unless specified otherwise.
3. Pre-cast spacer blocks of the strength not less than that of the concrete of girder, shall be provided as per the sketch to maintain the correct spacing of the main bars during concreting but these should not be placed at points of maximum bending moment.
4. Main beams shall be given upward camber to account for dead load deflection as given in the diagram.
5. For details of slab and schedule of reinforcement, quantities and reactions refer Drawing No. BD/1 - 75A and BD/3 - 75A respectively.
6. The expansion joints shall be of the approved type.
7. Two layers of mesh reinforcement type 'A' one at 20 mm and the other at 100 mm from the concrete surfaces shall be provided above the bearings. Similar mesh reinforcement of suitable size shall also be provided in the pier/abutment caps below the bearings.
8. The location of jacks for lifting up the superstructure to replace bearings etc. is shown thus ⬆. These shall be distinctly etched on the cross girders and the pier/abutment caps. Mesh reinforcement type 'B' in two layers shall be provided in the girders and pier/abutment caps at jack positions at heights indicated in note 7 above.
9. The beam sections have been so proportioned that they permit use of modular shuttering which could be repeated easily for other spans.
10. The general arrangement of elastomeric bearings to be provided shall be as per Drawing No. BD/4-75B. Details of the elastomeric bearings for this design shall be as under. Tests and specification shall strictly comply with cl.2005 of M.O.S.&T. specification.
    - i. Length (a) = 630 mm
    - ii. Width (b) = 220 mm
    - iii. No. of internal elastomeric layers = Four
    - iv. Overall thickness of bearings = 4x10+3x3+2x3 = 61 mm.
    - v. Design vertical load (DL+LL+Impact) = 85 tonnes.
11. All dimensions are in millimetres. Only written dimensions shall be followed.
12. For additional notes refer Drg. No, BD/3-75A.

REVISION	YEAR	DESCRIPTION	SIGNATURES

TOTAL QUANTITIES (PER SPAN)

1. STEEL: (including 5% extra for laps and wastage) = 7323 kgs.
2. CONCRETE: (excluding wearing coat and railings) = 43.75 cu.m.

NOTES :-

1. This drawing shall be read in conjunction with Drawing No. BD/1 -75A and BD/2 -75A showing the details of R.C.C. Deck Slab and R.C.C. Girders respectively.
2. The width of each panel of pre-cast footpath slab may be such as to facilitate easy handling.
3. Full scale elevation for the bars shall be lined out on a plain plastered floor to the dimensions shown on the drawing so as to get correct clearance between different bars and then the bars bent up to proper shape.
4. Dimensions in the schedule are given as per I.S:2502-1963.

ADDITIONAL NOTES FOR DRG. NO. BD/2-75A :

1. At the time of replacement of elastomeric bearings (whenever necessary), uniform seating of the main girders over the new bearings shall be ensured.
2. During jacking operation all the six jacks placed under one end x-girder shall be operated simultaneously using stress control system so as to ensure that the reactions on all the six jacks are equal at all times.
3. Maximum reaction on any jack under lifting condition = 10.3 tonnes.
4. Maximum design bearing pressure on sub-structure = 72 kg/cm².

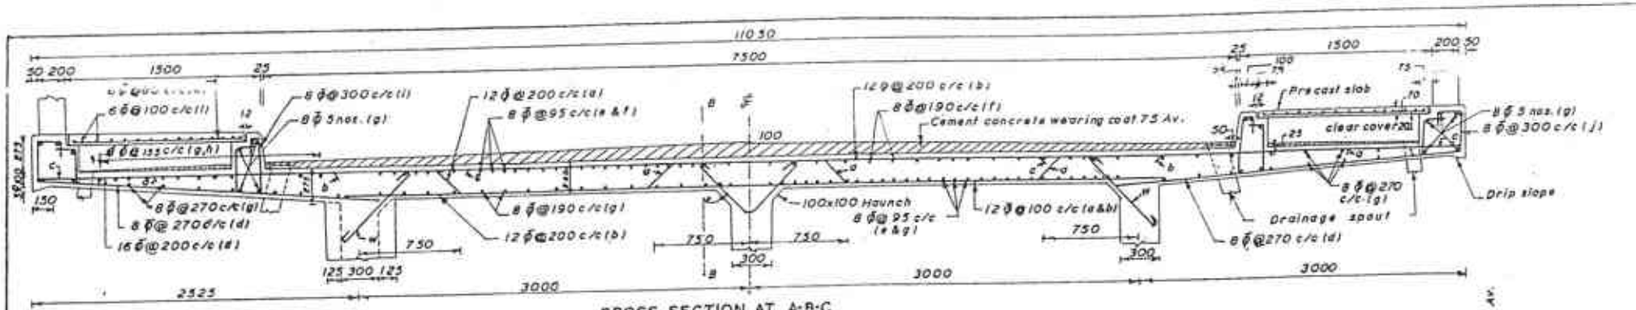
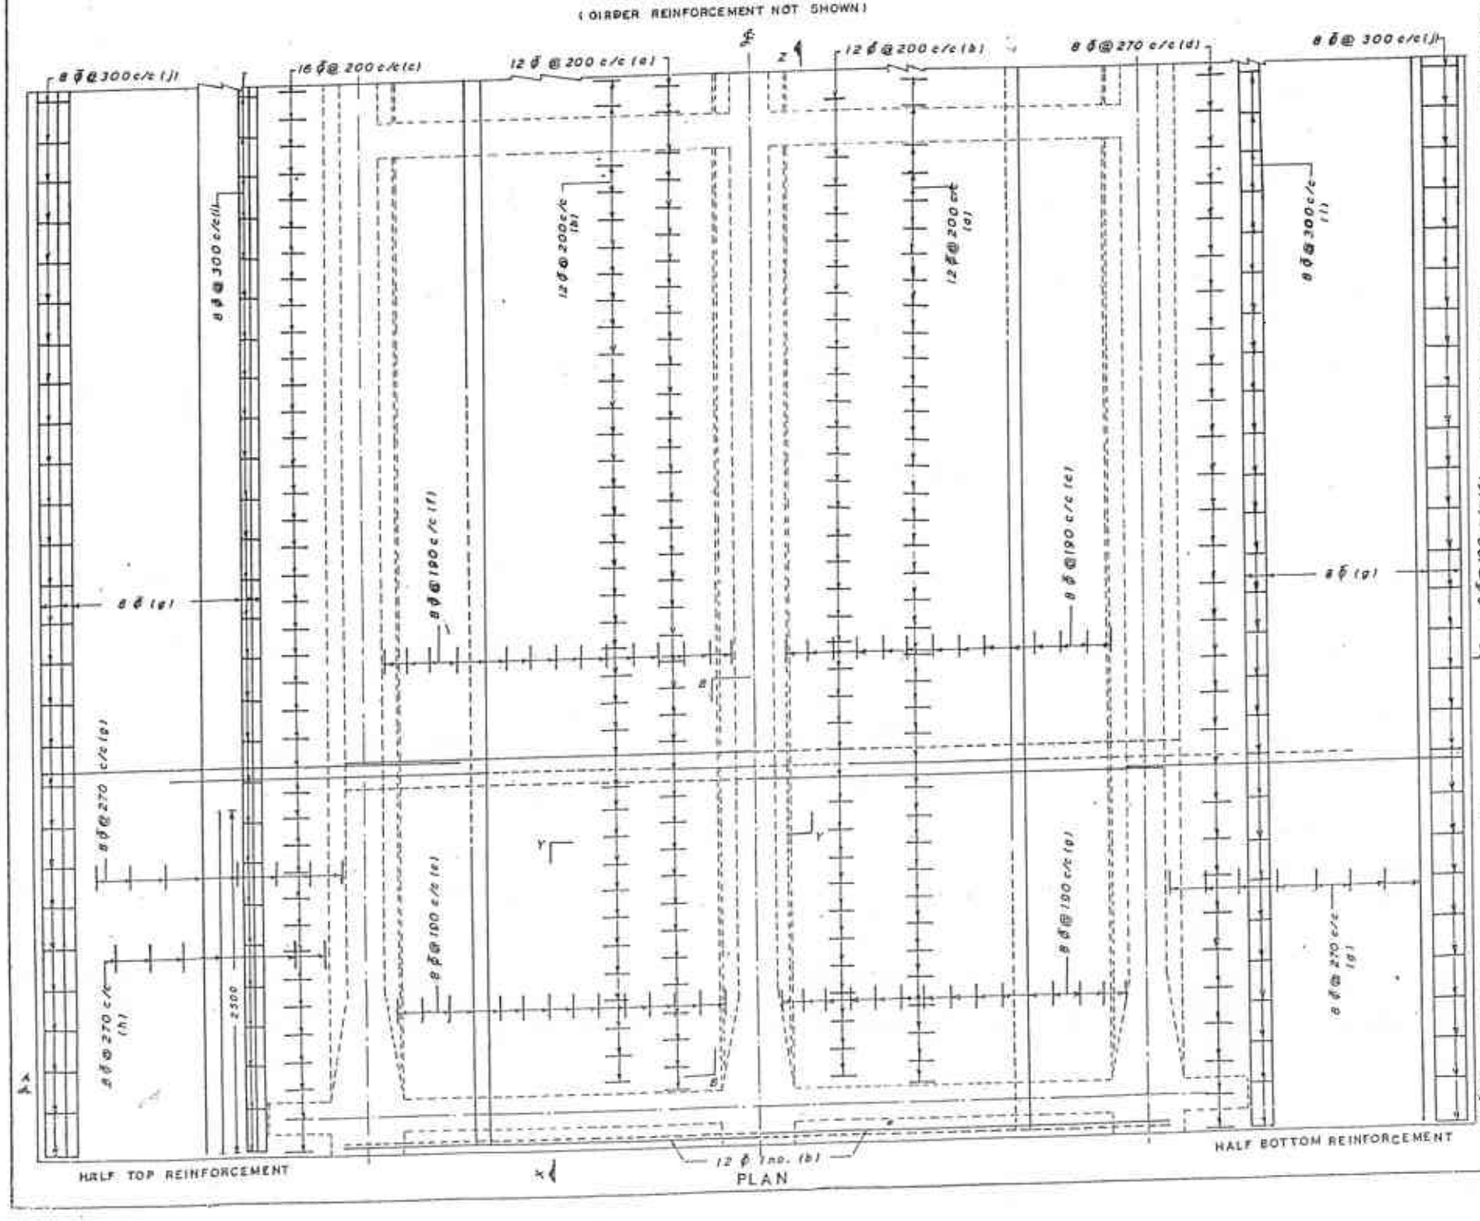
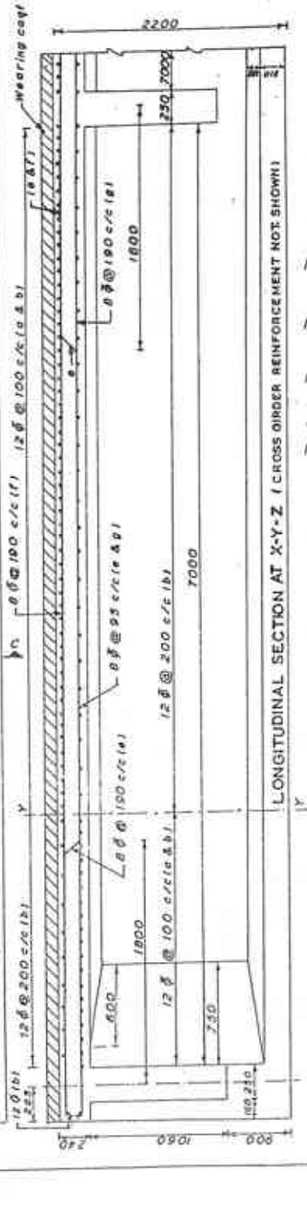
High Yield Strength Deformed Bars







NOTES.

1. The design is according to the following Bridge Codes: (i) IRC : 5 - 1970, (ii) IRC: 6 - 1966 & (iii) IRC: 21-1972 with latest amendments.
2. All dimensions are in millimetres
3. Concrete for both beams and slab shall have a minimum 28 days works crushing strength of 200 Kgs/cm^2 on 150 mm. cubes.
4. Reinforcing steel used shall be High Yield Strength Deformed Bars conforming to IS: 1139-1966 (with latest amendments) or IS: 1786-1966 (latest amendments)
5. This drawing shall not be applicable where reinforcing bars are joined by welding.
6. Joints or lapping of bars in main reinforcement shall be avoided as far as possible. However, the provision in clause no. 304. 6. 3 of IRC: 21-1972 should be strictly followed, if laps are provided.
7. Minimum cover to any reinforcement shall be 25mm.
8. Pre-cast mortar blocks of same strength as the slab concrete shall be used under the reinforcement to ensure the required cover.
9. Support bars of 12 ϕ shall be provided at suitable intervals as per IS: 2502-63.
10. Chamfers or fillets of size 25 mm x 25 mm shall be provided at all angles of the form-work unless otherwise specified in the drawing.
11. The railing shall be of any approved type. The reinforcement from railing should be anchored in kerb before casting the slab.
12. For details of wearing coat and drainage refer Drawing No. BD/1-69 A.
13. Properly stiffened steel plate shall be used as shuttering.
14. The width of each pre-cast R.C.C. footpath slab shall be such as to facilitate easy handling. The top surface should be clearly marked and shall be handled properly to avoid cracking. A wearing course of pre-cast chequered tiles, fixed firmly and true to levels may be provided
15. This drawing shall be read in conjunction with following Drawings:
    (i) BD/2-80 showing details of longitudinal girders.
    (ii) BD/3-80 showing details of cross girders.
    (iii) BD/4-80 showing schedule of reinforcement.
16. This drawing shall not be used in unfavourable conditions of exposure such as marine atmosphere etc. unless approved, measures are taken to protect the reinforcement from corrosion.

1. For general notes refer Drawing No. BD/1-80 .
2. Clear cover shall not be less than 40 mm for main reinforcement and 25 mm for other reinforcement .
3. Precast spacer blocks of the strength not less than that of the concrete of girders shall be provided as per the sketch to maintain the correct spacing of the main bars during concreting . But these should not be placed at points of maximum bending moment .
4. Main beams shall be given upward camber to account for dead load deflection as given in the diagram .
5. This drawing shall be read in conjunction with following drawings :
   (i) BD/1-80 showing details of slab ,
   (ii) BD/3-80 showing details of cross girders , and
   (iii) BD/4-80 showing schedule of reinforcement .
6. The expansion joints shall be of the approved type .
7. Two layers of mesh reinforcement type 'A' one at 20 mm and the other at 130 mm from the concrete surface shall be provided above the bearings . Similar mesh reinforcement of suitable size shall also be provided in the pier/abutment caps below the bearings .
8. The beam sections have been so proportioned that they permit use of modular shuttering which could be repeated easily for other spans .
9. The general arrangement of elastomeric bearings to be provided shall be as per Drawing No. BD/4-75B . Details of the elastomeric bearings for this design shall be as under :
   (i) Length (a) = 500 mm
   (ii) Width (b) = 360 mm
   (iii) Thickness of each internal elastomer layer = 12 mm
   (iv) Thickness of steel reinforcing plate = 3 mm
   (v) No. of internal elastomeric layer = Six
   (vi) Overall thickness of bearing = 99 mm
   (vii) Maximum design bearing pressure on substructure = 72 kg/cm².
   (viii) Design vertical load (D.L.+L.L.+ Impact) = 117.25 tonnes.
10. All dimensions are in millimetres .
11. This drawing shall not be applicable where reinforcing bars are joined by welding .
12. At the time of replacement of elastomeric bearings (whenever necessary), uniform seating of the main girders over the new bearings should be ensured .
13. Tests and specifications for elastomeric bearings shall strictly comply with cl. 2005 of M.O.S.&T. specification .

TOTAL QUANTITIES (PER SPAN)

1. STEEL: = 9042 kgs.
   (including 5% extra for laps and wastage)
2. CONCRETE: = 53.55 cu.m

Note: These quantities do not include railing and wearing coat.

NOTES:

1. This drawing shall be read in conjunction with Drawing No. BD/5-75A and BD/6-75A showing the details of R.C.C. Deck Slab and R.C.C. Girders respectively.
2. The width of each panel of pre-cast footpath slab may be such as to facilitate easy handling.
3. Full scale elevation for the bars shall be lined out on a plain plastered floor to the dimensions shown on the drawing so as to get correct clearance between different bars and then the bars bent up to proper shape.
4. Dimensions in the schedule are given as per I.S:2502-1963.

ADDITIONAL NOTES FOR DRG. NO. BD/6-75A :

1. At the time of replacement of elastomeric bearings (whenever necessary), uniform seating of the main girders over the new bearings shall be ensured.
2. During jacking operation all the six jacks placed under one end cross-girder shall be operated simultaneously using stress control system so as to ensure that the reactions on all the six jacks are equal at all times.
3. Maximum reaction on any jack under lifting condition = 12.5 tonnes.
4. Maximum design bearing pressure on sub-structure = 72 kg/cm².

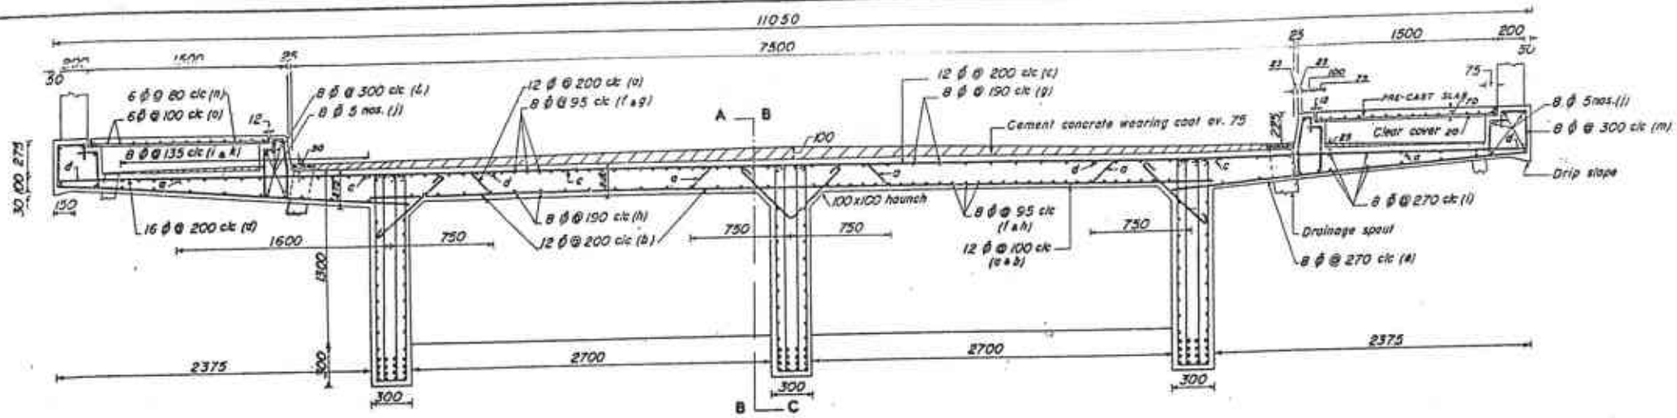
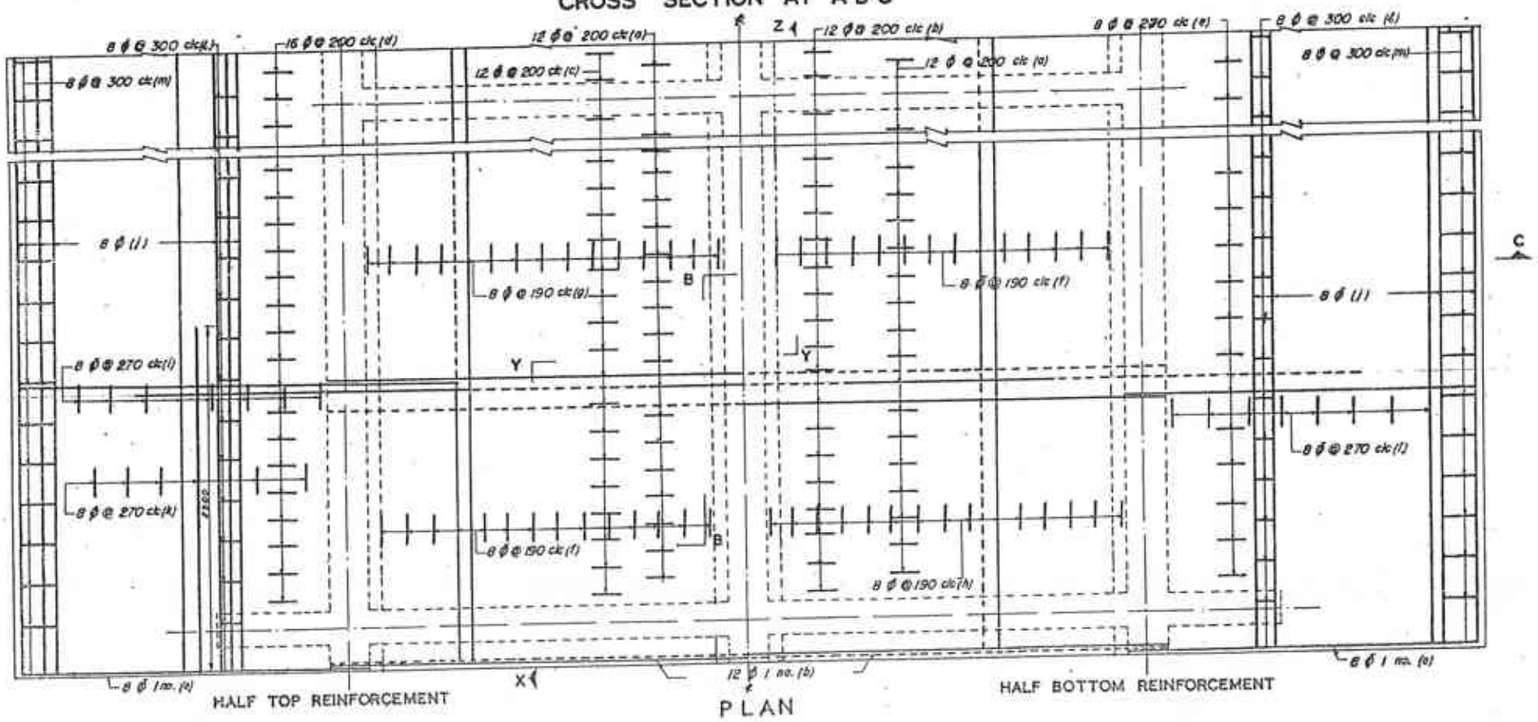
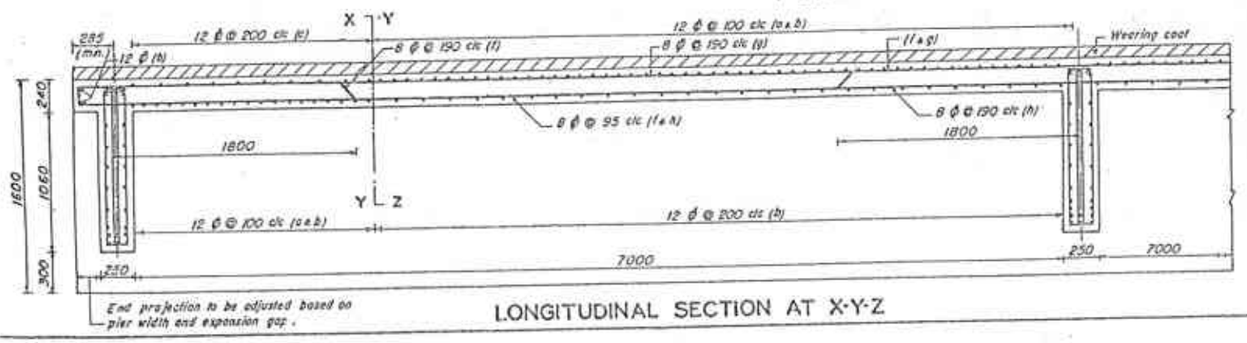
AUGUST, 1976.
DRG. No. BD/7 -75A.

High Yield Strength Deformed Bars



CROSS SECTION AT A-B-C





LONGITUDINAL SECTION AT X-Y-Z

NOTES :-

1. The design is according to the following Bridge Codes: (i) I.R.C. 5-1970, (ii) I.R.C. 6-1966 & (iii) I.R.C. 21-1972.
2. All dimensions are in millimetres. Only written dimensions shall be followed.
3. Concrete for both beams and slab shall have a minimum 28 days works crushing strength of 200 kg/cm^2 on 150 mm cubes.
4. Reinforcing steel used shall be High Yield Strength Deformed Bars with minimum yield stress of 42.5 kg/mm^2 and conforming to I.S. 1139-1966 (with amendment No. 1 of August, 1968 and amendment No. 2 of November, 1970) or I.S. 1786-1966 (with amendment No. 1 of August, 1968 and amendment No. 2 of December, 1970).
5. Joints or lapping of bars in main reinforcement shall be avoided as far as possible. However the provision in clause No. 304.6.3 of I.R.C. 21-1972 should be strictly followed; if laps are provided.
6. Minimum cover to any reinforcement shall be 25 mm unless shown otherwise in the drawing.
7. Pre-cast mortar blocks of the same strength as the slab concrete, shall be used under the reinforcement to ensure the required cover.
8. Support chairs of 12 ϕ bars shall be provided at suitable intervals.
9. The railing shall be of any approved type. The reinforcement from railing should be anchored in the kerb before casting the slab.
10. For details of wearing coat and drainage refer Drawing No. BD/1-69A.
11. Properly stiffened welded steel plates shall be used as shuttering.
12. The width of each pre-cast R.C.C. footpath slab shall be such as to facilitate easy handling. The top surface should be clearly marked and shall be handled properly to avoid cracking. A wearing course of precast chequered tiles, fixed firmly and true to levels, may be provided.
13. For details of Girders, Bearings & Schedule of Reinforcement, Quantities and Reactions refer Drg. No. BD/13-75A & BD/14-75A.
14. This drawing shall not be used in unfavourable conditions of exposure such as marine atmosphere etc. unless approved measures are taken to protect the reinforcement from corrosion.

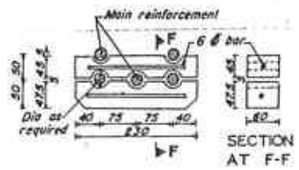
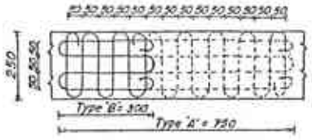
DEAD LOAD DEFLECTION DIAGRAM



PRE-CAST SPACER BLOCKS FOR CROSS GIRDERS

SPACING - 3000 (APPROX)

(Various layers of spacer blocks may be staggered horizontally by 150 mm.)



MESH REINFORCEMENT 6 mm

NOTES :-

1. For general notes refer Drawing No. BD/12-75.
2. Clear cover shall not be less than 40 mm for main reinforcement and 25 mm for other reinforcement unless specified otherwise.
3. Pre-cast spacer blocks of the strength not less than that of the concrete of girder, shall be provided as per the sketch to maintain the correct spacing of the main bars during concreting but these should not be placed at points of maximum Bending Moment.
4. Main beams shall be given upward camber to account for dead load deflection as given in the diagram.
5. For details of slab and schedule of reinforcement, quantities and reactions refer Drawing No. BD/12-75 and BD/14-75A respectively.
6. The expansion joints shall be of the approved type.
7. Two layers of mesh reinforcement type 'A' one at 20 mm and the other at 100 mm from the concrete surfaces shall be provided above the bearings. Similar mesh reinforcement of suitable size shall also be provided in the pier/abutment caps below the bearings.
8. The location of jacks for lifting up the superstructure to replace bearings etc. is shown thus ⬆. These shall be distinctly etched on the cross girders and the pier/abutment caps. Mesh reinforcement type 'B' in two layers shall be provided in the girders and pier/abutment caps at jack positions at heights indicated in note 7 above.
9. The beam sections have been so proportioned that they permit use of modular shuttering which could be repeated easily for other spans.
10. The general arrangement of elastomeric bearings to be provided shall be as per Drawing No. BD/4-75B. Details of the elastomeric bearings for this design shall be as under. Tests and specification shall strictly comply with cl.2005 of M.O.S.&T. specification.
    - I. Length (a) = 710 mm
    - II. Width (b) = 200 mm
    - III. No. of internal elastomeric layers = 3
    - IV. Overall thickness of bearing = 3x10 + 4x3 + 2x3 = 48 mm.
    - V. Design vertical load (DL+LL+ Impact) = 96 tonnes.
    - II. All dimensions are in millimetres.
12. For additional notes refer drg. BD/14-75A.

High Yield Strength Deformed Bars

NOTES :-

1. The design is according to the following Bridge Codes, (i) I.R.C. 5-1970, (ii) I.R.C : 6-1966 & (iii) I.R.C : 21-1972.
2. All dimensions are in millimetres. Only written dimensions shall be followed.
3. Concrete for both beams and slab shall have a minimum 28 days works crushing strength of 300 kg/cm² on 150 mm cubes.
4. Reinforcing steel used shall be High Yield Strength Deformed Bars conforming to I.S. 1139-1966 (with amendment No. 1 of August, 1968 & amendment No. 2 of November, 1970) or I.S. 1786-1966 (with amendment No. 1 of August, 1968 and amendment No. 2 of December, 1970)
5. Joints or lapping of bars in main reinforcement shall be avoided as far as possible. However the provision in clause No. 304, 6.3 of I.R.C ; 21-1972 should be strictly followed, if laps are provided.
6. Minimum cover to any reinforcement shall be 25 mm unless shown otherwise in the drawing.
7. Pre-cast mortar blocks of the same strength as the slab concrete, shall be used under the reinforcement to ensure the required cover.
8. Support chairs of 12 ϕ bars shall be provided at suitable intervals.
9. The railing shall be of any approved type. The reinforcement from railing should be anchored in the kerb before casting the slab.
10. For details of wearing coat and drainage, refer Drawing No. BD/1-69A.
11. Properly stiffened welded steel plates shall be used as shuttering.
12. The width of each precast R.C.C. footpath slab shall be such as to facilitate easy handling. The top surface should be clearly marked and shall be handled properly to avoid cracking. A wearing course of precast chequered tiles, fixed firmly and true to levels, may be provided.
13. For details of Girders, Bearings and Schedule of Reinforcement, Quantities and Reactions refer Drg. No. BD/2-76A and BD/3-76A.
14. The drawing shall not be used in unfavourable conditions of exposure such as marine atmosphere etc. unless approved measures are taken to protect the reinforcement from corrosion.

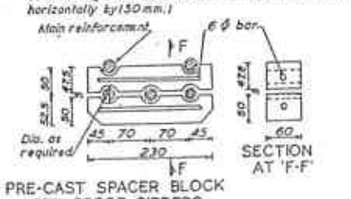
(Various layers of spacer blocks may be staggered horizontally by 150 mm.)



SECTION AT F-F

PRE-CAST SPACER BLOCK FOR CROSS GIRDERS
SPACING - 3000 (APPX.)

NOTES :-

1. For general notes refer Drawing No. BD/1-76.
2. Clear cover shall not be less than 40 mm for main reinforcement and 25 mm for other reinforcement unless specified otherwise.
3. Pre-cast spacer blocks of the strength not less than that of the concrete of girder, shall be provided as per the sketch to maintain the correct spacing of the main bars during concreting but these should not be placed at points of maximum bending moment.
4. Main beams shall be given upward camber to account for dead load deflection as given in diagram.
5. For details of slab and schedule of reinforcement, quantities and reactions refer Drawing No. BD/1-76 and BD/3-76A respectively.
6. The expansion joints shall be of the approved type.
7. Two layers of mesh reinforcement type 'A' one at 20 mm and other at 100 mm from the concrete surfaces shall be provided above the bearings. Similar mesh reinforcement of suitable size shall also be provided in the pier/abutment caps below the bearings.
8. The location of jacks for lifting up the superstructure to replace bearings etc. is shown thus ↑. These shall be distinctly etched on the cross girders and the pier/abutment caps. Mesh reinforcement type 'B' in two layers shall be provided in the girders and pier/abutment caps at jack positions at heights indicated in note 7 above.
9. The beam sections have been so proportioned that they permit use of modular shuttering which could be repeated easily for other spans
10. The general arrangement of elastomeric bearings to be provided shall be as per Drawing No. BD/4-75A. Details of the elastomeric bearings for this design shall be as under. Tests and specification shall strictly comply with cl. 2005 of M.O.S & T. specification.
    - I. Length (a) = 710 mm.
    - II. Width (b) = 220 mm.
    - III. No. of internal elastomeric layers = Four
    - IV. Overall thickness of bearing = 4 x 10 + 5 x 3 + 2 x 3 = 61 mm.
    - V. Design vertical load (DL + LL + Impact) = 102 tonnes.
11. All dimensions are in millimetres. Only written dimensions shall be followed.
12. For additional notes refer Drg No. BD/3-76A.

TOTAL QUANTITIES (PER SPAN)

1. STEEL (including 5% extra for laps and wastage) = 12713. Kgs.
2. CONCRETE = 77.20 cum.

Note: These quantities do not include railing and wearing coat.

NOTES:

1. This drawing shall be read in conjunction with Drawing No. BD/1-76 and BD/2-76A showing the details of R.C.C. Deck Slab & R.C.C. Girders respectively.
2. The width of each panel of pre-cast footpath slab may be such as to facilitate easy handling.
3. Full scale elevation for the bars shall be lined out on a plain plastered floor to the dimensions shown on the drawing so as to get correct clearance between different bars and then the bars bent up to proper shape.
4. Dimensions in the schedule are given as per I.S.2502-1963.

ADDITIONAL NOTES FOR DRG. NO. BD/2-76A :

1. At the time of replacement of elastomeric bearings (whenever necessary), uniform seating of the main girders over the new bearings shall be ensured.
2. During jacking operation all the six jacks placed under one end x-girder shall be operated simultaneously using stress control system so as to ensure that the reactions on all the six jacks are equal at all times.
3. Maximum reaction on any jack under lifting condition = 17.7 tonnes.
4. Maximum design bearing pressure on sub-structure = 72 kg/cm².

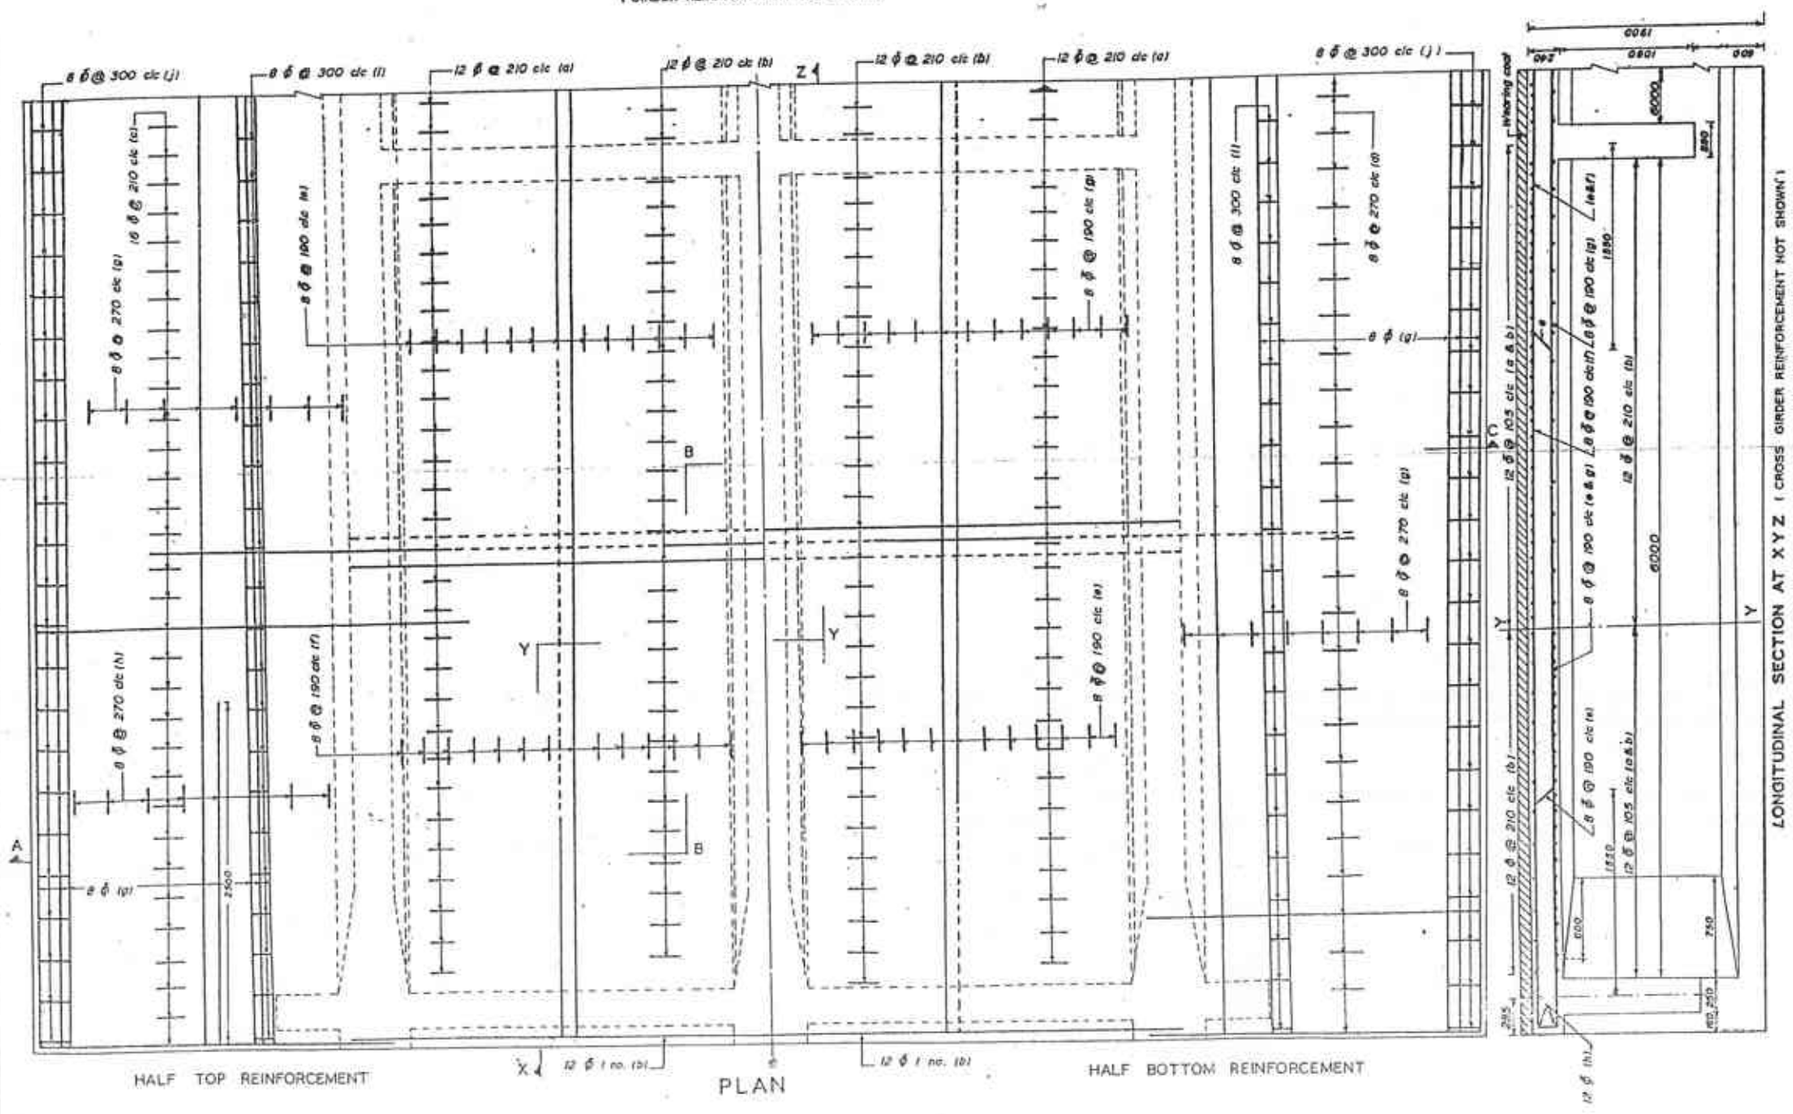
CROSS SECTION AT ABC

(GIRDER REINFORCEMENT NOT SHOWN)



HALF TOP REINFORCEMENT

PLAN

HALF BOTTOM REINFORCEMENT

LONGITUDINAL SECTION AT XYZ (CROSS GIRDER REINFORCEMENT NOT SHOWN)

NOTES :-

1. The design is according to the following Bridge Codes : (i) IRC : 5 - 1970, (ii) IRC : 6 - 1966 & (iii) IRC : 21 - 1972 with latest amendments .
2. All dimensions are in millimetres .
3. Concrete for both beams and slab shall have a minimum 28 days works crushing strength of 200 kg/cm² on 150mm cubes .
4. Reinforcing steel used shall be High Yield Strength Deformed Bars conforming to IS : 1139-1966 (with latest amendments) or IS : 1786-1966 (with latest amendments) .
5. This drawing shall not be applicable where reinforcing bars are joined by welding .
6. Joints or lapping of bars in main reinforcement shall be avoided as far as possible . However , the provision in clause No. 304.6.3 of IRC : 21-1972 should be strictly followed , if laps are provided .
7. Minimum cover to any reinforcement shall be 25 mm.
8. Pre-cast mortar blocks of the same strength as the slab concrete shall be used under the reinforcement to ensure the required cover .
9. Support bars of 12 mm dia. shall be provided at suitable intervals as per IS : 2502-1963 .
10. Chamfers or fillets of size 25mm x 25mm shall be provided at all angles of the form work unless otherwise specified in the drawing .
11. The railing shall be of any approved type. The reinforcement from railing should be anchored in the kerb before casting the slab .
12. For details of wearing coat and drainage refer Drawing No. BD/1-79A.
13. Properly stiffened steel plates shall be used as shuttering ,
14. This drawing shall be read in conjunction with the following drawings :
    (i) BD/6-79 showing details of longitudinal girders ,
    (ii) BD/5-79A showing details of cross girders , and
    (iii) BD/8-79A showing schedule of reinforcement .
15. The width of each pre-cast R.C.C. footpath slab shall be such as to facilitate easy handling . The top surface should be clearly marked and shall be handled properly to avoid cracking . A wearing course of pre-cast chequered tiles fixed firmly and true to levels shall be provided.
16. This drawing shall not be used in unfavourable conditions of exposure such as marine atmosphere etc. unless approved measures are taken to protect the reinforcement from corrosion .

NOTES :-

1. For general notes refer Drawing No. BD/5-79
2. Clear cover shall not be less than 40 mm for main reinforcement and 25mm for other reinforcement.
3. Pre-cast spacer blocks of the strength not less than that of the concrete of girder, shall be provided as per the sketch to maintain the correct spacing of the main bars during concreting but these should not be placed at points of maximum bending moments.
4. Main beams shall be given upward camber to account for dead load deflection as given in the diagram.
5. This drawing shall be read in conjunction with following :
   - (i) Drg. No. BD/5-79 showing details of slab
   - (ii) Drg. No. BD/7-79A showing details of cross girders
   - (iii) Drg. No. BD/8-79A showing schedule of reinforcement.
6. The expansion joints shall be of the approved type.
7. Two layers of mesh reinforcement type 'A' one at 20 mm and the other at 130 mm from the concrete surfaces shall be provided above the bearings. Similar mesh reinforcement of suitable size shall also be provided in the pier/abutment caps below the bearings.
8. The beam sections have been so proportioned that they permit the use of modular shuttering which could be repeated easily for other spans.
9. The general arrangement of elastomeric bearings to be provided shall be as per Drawing No. BD/4-75B. Details of the elastomeric bearings for this design shall be as under. Tests and specifications shall strictly comply with cl. 2005 of M.O.S. & T. specification.
   - i. Length (a) = 500 mm
   - ii. Width (b) = 360 mm
   - iii. Thickness of each internal elastomer layer = 12 mm
   - iv. Thickness of steel reinforcing plate = 3 mm
   - v. No. of internal elastomeric layers = six
   - vi. Overall thickness of bearing = 99 mm
   - vii. Maximum design bearing pressure on sub-structure = 72 kgs/cm2.
   - viii. Design vertical load (DL+LL+Impact) = 110 Tonnes
10. All dimensions are in millimetres.
11. This drawing shall not be applicable where reinforcing bars are joined by welding.
12. At the time of replacement of elastomeric bearings (whenever necessory) uniform seating of the main girders over the new bearings should be ensured.

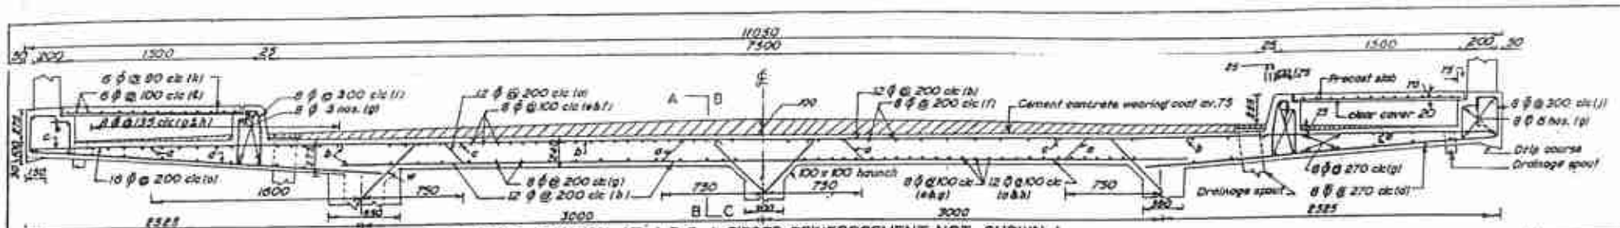
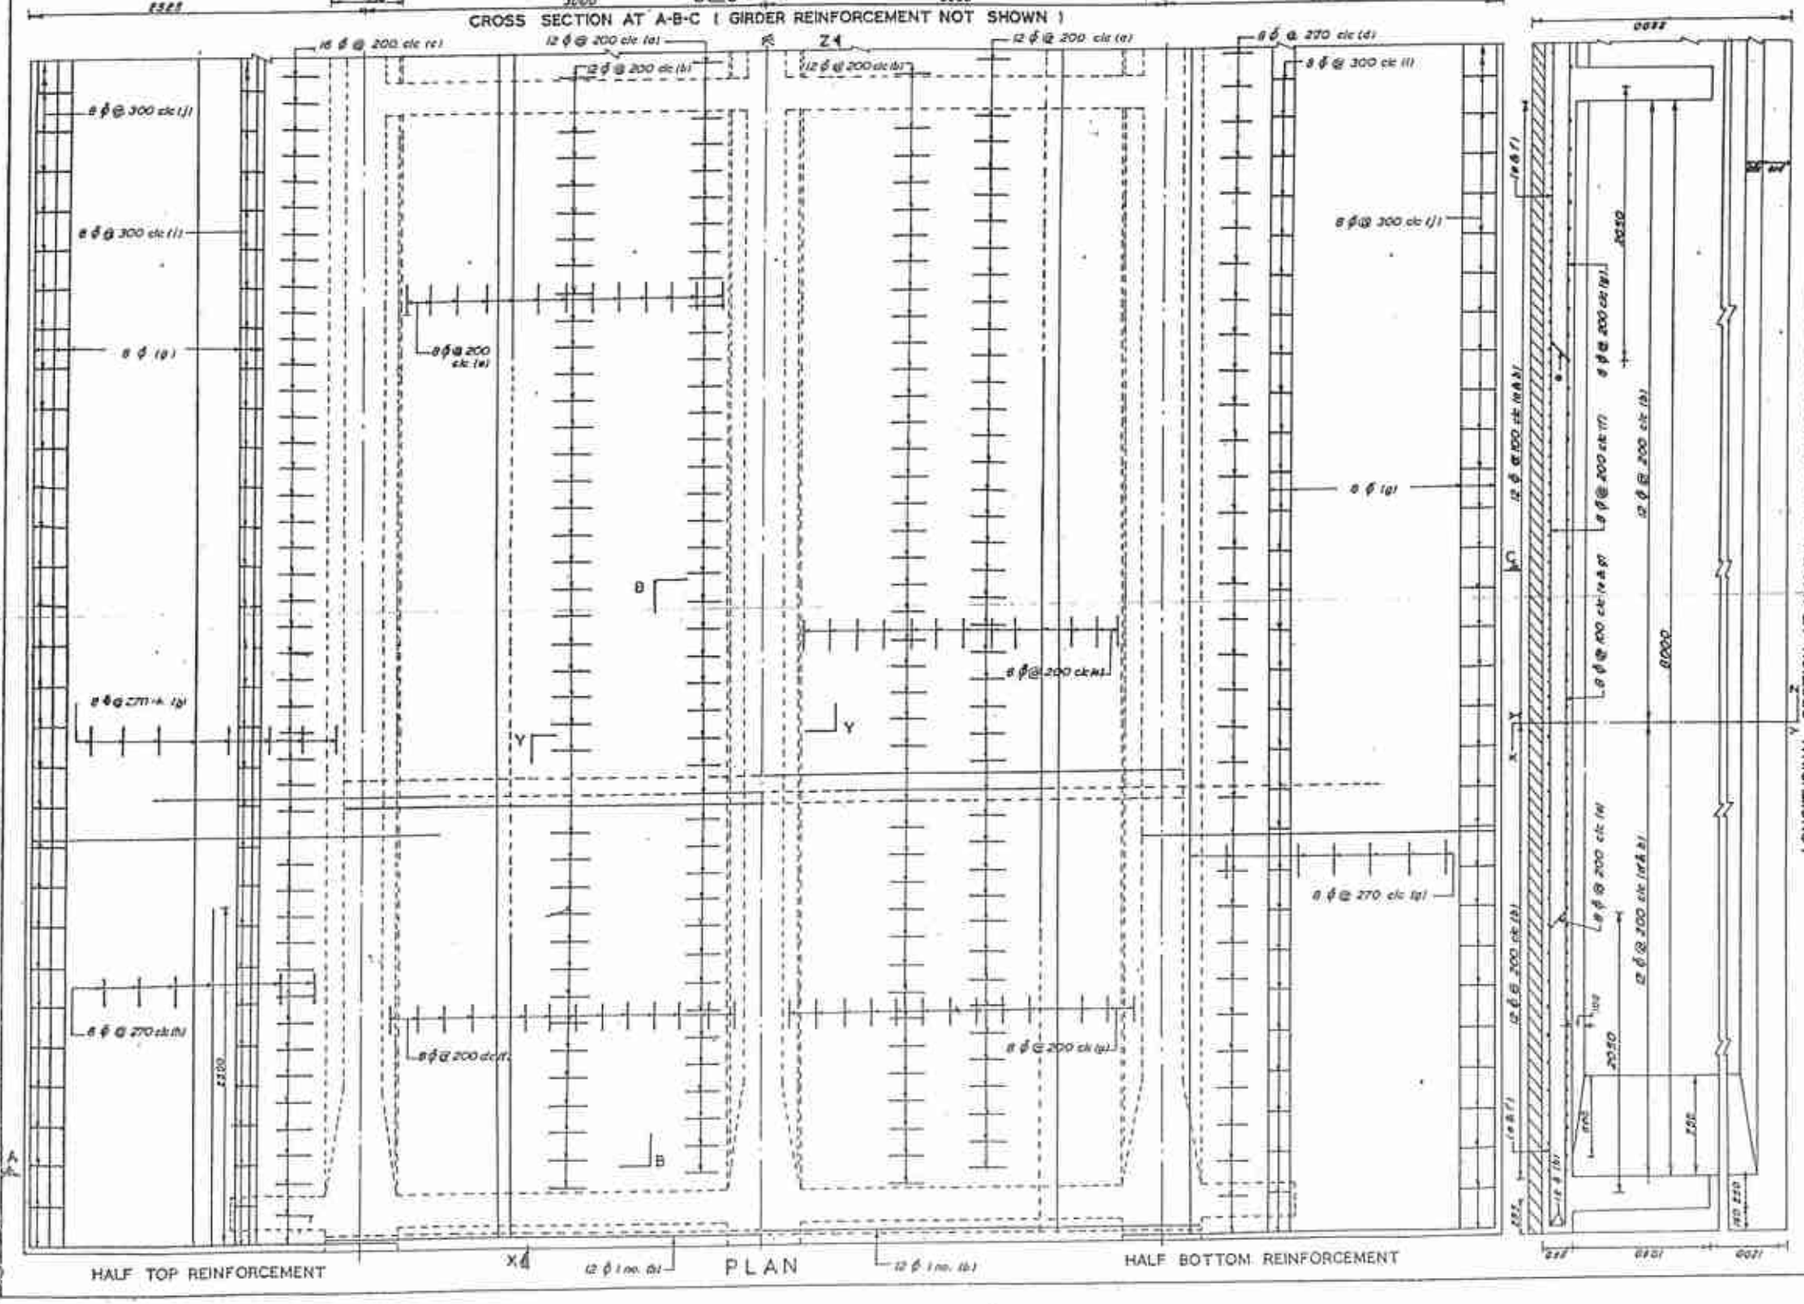
JULY, 1980.
DRG. NO. BD/4 - 80.

High Yield Strength Deformed Bars

CROSS SECTION AT A-B-C (GIRDER REINFORCEMENT NOT SHOWN)





NOTES :-

1. The design is according to the following bridge codes : (i) IRC : 5-1970, (ii) IRC : 6-1966 & (iii) IRC : 21-1972 with latest amendments .
2. All dimensions are in millimetres .
3. Concrete for both beams and slab shall have a minimum 28 days works crushing strength of 200 kg/cm² on 150 mm cubes .
4. Reinforcing steel used shall be High Yield Strength Deformed Bars conforming to IS : 1139-1966 (with latest amendments) or IS : 1786-1966 (with latest amendments) .
5. This drawing shall not be applicable where reinforcing bars are joined by welding .
6. Joints or lapping of bars in main reinforcement shall be avoided as far as possible . However the provision in clause No. 304.6.3 of IRC : 21-1972 should be strictly followed, if laps are provided .
7. Minimum cover to any reinforcement shall be 25 mm .
8. Precast mortar blocks of same strength as the slab concrete shall be used under the reinforcement to ensure the required cover .
9. Support bars of 12mm dia. shall be provided at suitable intervals as per IS : 2502-1963 .
10. Chamfers or fillets of sizes 25mm x 25mm shall be provided at all angles of the form work unless otherwise specified in the drawing .
11. The railing shall be of any approved type . The reinforcement from railing should be anchored in the kerb before casting the slab .
12. For details of wearing coat and drainage spouts refer drawing No. BD1 :-69 A .
13. Properly stiffened steel plates shall be used as shuttering .
14. The width of each precast R.C.C. footpath slab shall be such as to facilitate easy handling. The top surface should be clearly marked and shall be handled properly to avoid cracking . A wearing course of precast chequered tiles, fixed firmly and true to levels may be provided .
15. This drawing shall be read in conjunction with the following drawings: (i) BD/6-80 showing details of longitudinal girders, (ii) BD/7-80 showing details of cross girders, and (iii) BD/8-80 showing schedule of reinforcement
16. This drawing shall not be used in unfavourable conditions of exposure such as marine atmosphere etc. unless approved measures are taken to protect the reinforcement from corrosion.

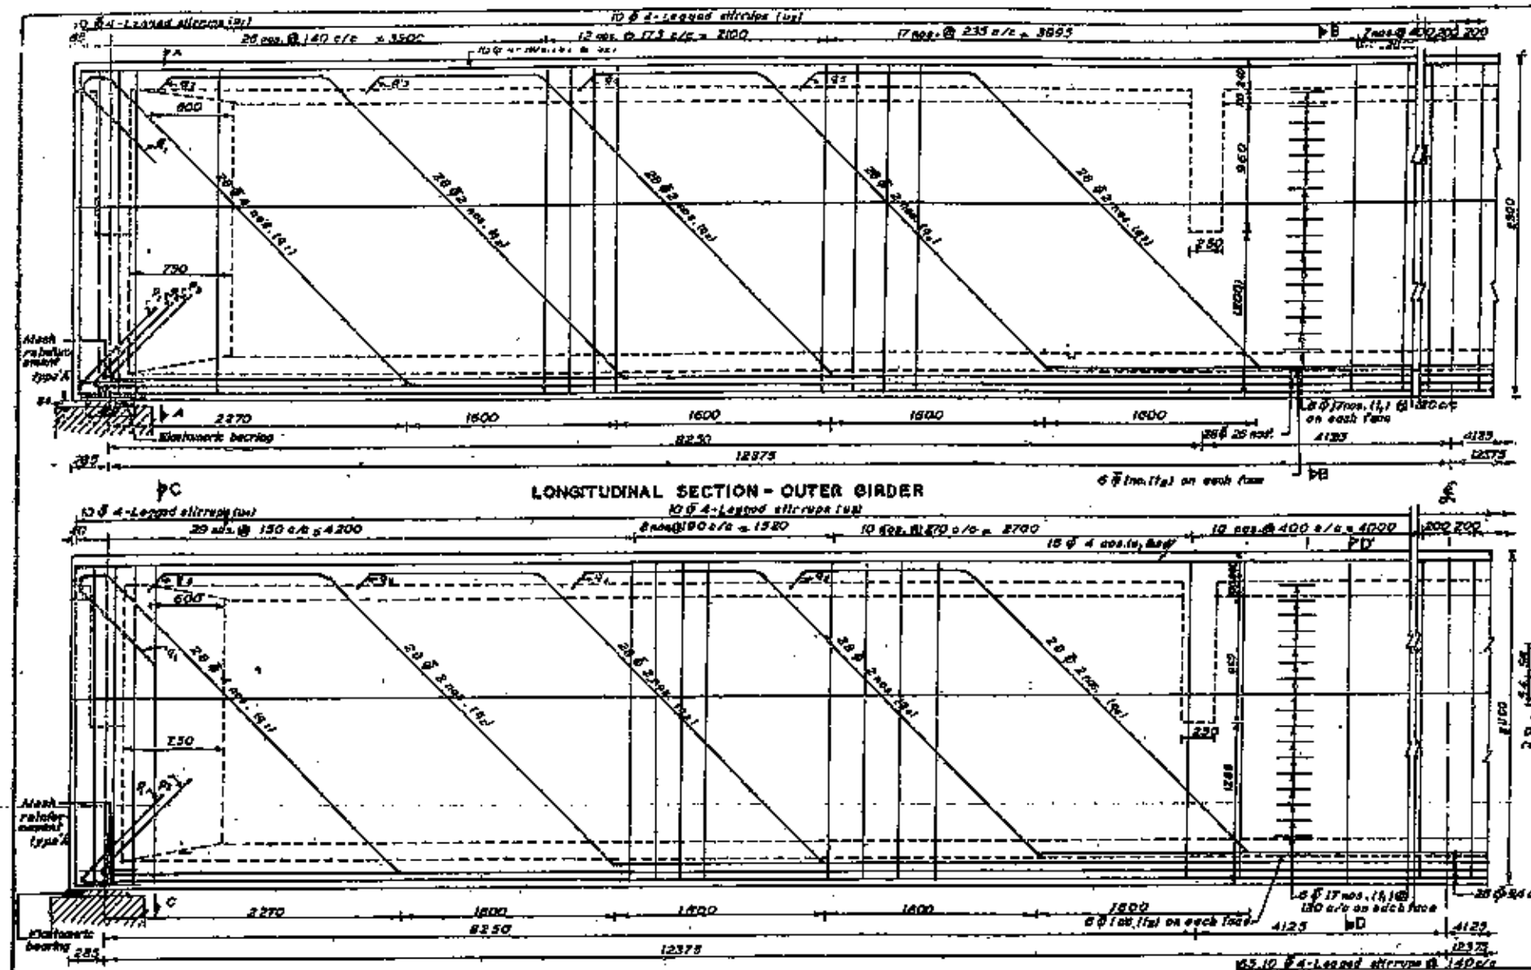
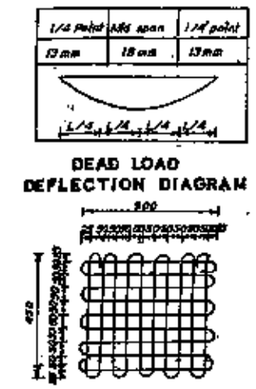
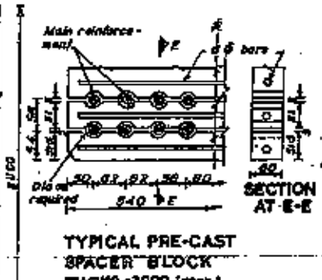
High Yield Strength Deformed Bars







TYPICAL PRE-CAST SPACER BLOCK

SPACING @ 3000 (approx.)

(Various layers may be staggered horizontally by 150 mm).

NOTES:

1. For general notes refer Drawing No. BD/5-80.
2. Clear cover shall not be less than 40mm for main reinforcement and 25 mm for other reinforcement.
3. Pre-cast spacer blocks of strength not less than that of the concrete of girder, shall be provided as per the sketch to maintain the correct spacing of the main bars during concreting but these should not be placed at points of maximum bending moments.
4. Main beams shall be given upward camber to account for dead load deflection as given in the diagram.
5. This drawing shall be read in conjunction with the following:
   (i) Drawing no. BD/5-80 showing details of slab.
   (ii) Drawing no. BD/7-80 showing details of cross girder.
   (iii) Drawing no. BD/8-80 showing schedule of reinforcement.
6. The expansion joints shall be of the approved type.
7. Two layers of mesh reinforcement type 'A' one at 20mm and the other at 130mm from the concrete surfaces shall be provided above the bearings. Similar mesh reinforcement of suitable size shall also be provided in the pier/abutment caps below the bearings.
8. The beam sections have been so proportioned that they permit the use of modular shuttering which could be repeated easily for other spans.
9. The general arrangement of elastomeric bearings to be provided shall be as per Drawing No. BD/4-78 B. Details of the elastomeric bearings for this design shall be as under:
   (i) Length (a) = 500 mm.
   (ii) Width (b) = 400 mm.
   (iii) Thickness of each internal elastomeric layer = 12 mm.
   (iv) Thickness of steel reinforcing plate = 3 mm.
   (v) No. of internal elastomeric layers = Five
   (vi) Overall thickness of bearing = 84 mm.
   (vii) Maximum design bearing pressure on substructure = 72 Kgs./cm².
   (viii) Design Vertical load (DL+LL+Impact) = 132 tonnes.
10. All dimensions are in millimetres.
11. This drawing shall not be applicable where reinforcing bars are joined by welding.
12. At the time of replacement of elastomeric bearings (whenever necessary) uniform seating of the main girders over the new bearings should be ensured.
13. Tests and specifications for elastomeric bearings shall strictly comply with cl. 2005 of M.O.S. & T. specification.

NOTES:

1. This drawing shall be read in conjunction with Drawing No. BD/5-80, BD/6-80 and BD/7-80 showing the details of R.C.C. Deck Slab, Longitudinal Girders and Cross Girders respectively.
2. Full scale elevation for the bars shall be lined out on a plain plastered floor to the dimensions shown on the drawing so as to get correct clearance between different bars and then the bars bent up to proper shape.
3. Dimensions in the schedule are given as per I.S: 2502-1963.

MAXIMUM REACTION (IN TONNES)

	At Abutment		At pier		
D.L.	D.L+L.L (Without Impact)	D.L+L.L (With Impact)	D.L.	D.L+L.L (Without Impact)	D.L+L.L (With Impact)
187	279.20	290.90	374	466.70	489.60

TOTAL QUANTITIES (PER SPAN)

1. Steel :- = 21100 Kgs.
(Including 5% extra for laps and wastage)
2. Concrete :- = 138.30 cum
Note:- These quantities do not include railing and wearing coat.

NOTES :-

1. The design is according to the following Bridge Codes: (i) IRC : 5-1970, (ii) IRC : 6-1966 & (iii) IRC : 21-1972.
2. All dimensions are in millimetres.
3. Concrete for both beams and slab shall have a minimum 28 days works crushing strength of 200 kg/cm² on 150 mm cubes.
4. Reinforcing steel used shall be High Yield Strength Deformed Bars conforming to IS : 1139-1966 (with amendments No.1 & 2) or IS : 1786-1966 (with amendments No. 1 & 2).
5. Joints or lapping of bars in main reinforcement shall be avoided as far as possible. However, the provision in clause No. 304.6.3. of IRC : 21-1972 should be strictly followed ; if laps are provided.
6. Minimum cover to any reinforcement shall be 25 mm unless shown otherwise in the drawing.
7. Pre-cast mortar blocks of the same strength as the slab concrete, shall be used under the reinforcement to ensure the required cover.
8. Support chairs of 12 ϕ shall be provided at suitable intervals.
9. The railing shall be of any approved type. The reinforcement from railing should be anchored in the kerb before casting the slab.
10. For details of wearing coat and drainage refer Drawing No. BD/1-69A.
11. Properly stiffened welded steel plates shall be used as shuttering.
12. For details of Girders, Bearings & Schedule of Reinforcement, Quantities and Reactions refer Drawing No. BD/8-76A & BD/9-76A.
13. This drawing shall not be used in unfavourable conditions of exposure such as marine atmosphere etc. unless approved measures are taken to protect the reinforcement from corrosion.

MESH REINFORCEMENT 6mm.

NOTES :-

1. For general notes refer Drawing No. BD/7-76.
2. Clear cover shall not be less than 40 mm for main reinforcement and 25 mm for other reinforcement unless specified otherwise.
3. Pre-cast spacer blocks of the strength not less than that of the concrete of girder, shall be provided as per the sketch to maintain the correct spacing of the main bars during concreting but these should not be placed at points of maximum Bending Moment.
4. Main beams shall be given upward camber to account for dead load deflection as given in the diagram.
5. For details of slab and schedule of reinforcement, quantities and reactions refer Drawing No. BD/7-76 and BD/8-76A respectively.
6. The expansion joints shall be of the approved type.
7. TWO layers of mesh reinforcement type 'A' one at 50 mm and the other at 100 mm from the concrete surfaces shall be provided above the bearings. Similar mesh reinforcement of suitable size shall also be provided in the pier/abutment caps below the bearings.
8. The location of jacks for lifting up the superstructure to replace bearings etc. is shown thus ⊕. These shall be distinctly etched on the cross girders and the pier/abutment caps. Mesh reinforcement type 'B' in two layers shall be provided in the girders and pier/abutment caps at jack positions at heights indicated in note 7 above.
9. The beam sections have been so proportioned that they permit use of modular shuttering which could be repeated easily for other spans.
10. The general arrangement of elastomeric bearings to be provided shall be as per Drawing No. BD/4-75A. Details of the elastomeric bearings for this design shall be as under. Tests and specification shall strictly comply with cl. 2005 of M.O. S&T specification.
    - i. Length (a) = 460 mm.
    - ii. Width (b) = 220 mm.
    - iii. No. of internal elastomeric layers = Four
    - iv. Overall thickness of bearings = 5+(4×8)+4×3 = 79 mm
    - v. Design vertical load (DL + LL + Impact) = 75 tonnes
11. All dimensions are in millimetres.
12. For additional notes refer Drg. No. BD/8-76A.

TOTAL QUANTITIES (PER SPAN)

1. STEEL = 6187 Kgs.
(including 5% extra for laps and wastage)
2. CONCRETE = 33·30 cu.m.

Note: These quantities do not include railing and wearing coat.

NOTES:-

1. This drawing shall be read in conjunction with Drawing No. BD/7-76 and BD/8-76A showing the details of R.C.C. Deck Slab & R.C.C Girders respectively.
2. Full scale elevation for the bars shall be lined out on a plain plastered floor to the dimensions shown on the drawing so as to get correct clearance between different bars and then the bars bent up to proper shape.
3. Dimensions in the schedule are given as per IS:2502-1963

ADDITIONAL NOTES FOR DRG. NO. BD/8-76A :

1. At the time of replacement of elastomeric bearings (whenever necessary), uniform seating of the main girders over the new bearings shall be ensured.
2. During jacking operation all the four jacks placed under one end x-girder shall be operated simultaneously using stress control system so as to ensure that the reactions on all the four jacks are equal at all times.
3. Maximum reaction on any jack under lifting condition = 12.4 tonnes.
4. Maximum design bearing pressure on sub-structure = 72 kg/cm²

60.00	123.73	139.75	120.00	195.45	215.55

TOTAL QUANTITIES (PER SPAN)

1. Steel: = 7618 Kgs. (including 5% extra for laps and wastage)
2. Concrete: = 41.30 cu.m.

Note: These quantities do not include railing and wearing coat.

NOTES:-

1. This drawing shall be read in conjunction with Drawing No. BD/10-76 and BD/11-76A showing the details of R.C.C. Deck Slab & R.C.C. Girders respectively.
2. Full scale elevation for the bars shall be lined out on a plain plastered floor to the dimensions shown on the drawing so as to get correct clearance between different bars and then the bars bent up to proper shape.
3. Dimensions in the schedule are given as per I.S.2502-1963.

ADDITIONAL NOTES FOR DRG. NO. BD/11-76A :

1. At the time of replacement of elastomeric bearings (whenever necessary), uniform seating of the main girders over the new bearings shall be ensured.
2. During jacking operation all the four jacks placed under one end cross-girder shall be operated simultaneously using stress control system so as to ensure that the reactions on all the four jacks are equal at all times.
3. Maximum reaction on any jack under lifting condition = 15.0 tonnes.
4. Maximum design bearing pressure on sub-structure = 72 kg/cm².

NOTES :-

1. The design is according to the following Bridge Codes : (i) IRC: 5-1970, (ii) IRC: 6-1966 & (iii) IRC: 21-1972.
2. All dimensions are in millimetres.
3. Concrete for both beams and slab shall have a minimum 28 days works crushing strength of 200 kg/cm² on 150 mm cubes.
4. Reinforcing steel used shall be High Yield Strength Deformed Bars conforming to IS: 1139-1966 (with amendments No. 1 and 2) or IS: 1786-1966 (with amendments No.1 and 2).
5. Joints or lapping of bars in main reinforcement shall be avoided as far as possible. However the provision in clause No. 504.6.3 of IRC: 21-1972 should be strictly followed, if laps are provided.
6. Minimum cover to any reinforcement shall be 25 mm unless shown otherwise in the drawing.
7. Pre-cast mortar blocks of the same strength as the slab concrete, shall be used under the reinforcement to ensure the required cover.
8. Support chairs of 12 ϕ bars shall be provided at suitable intervals.
9. The railing shall be of any approved type. The reinforcement from railing should be anchored in the kerb before casting the slab.
10. For details of wearing coat and drainage refer Drawing No. BD/1-69 A.
11. Properly stiffened welded steel plates shall be used as shuttering.
12. For details of Girders, Bearings and Schedule of Reinforcement, Quantities and Reactions refer Drawing No. BD/5-76A and BD/6-76A.
13. This drawing shall not be used in unfavourable conditions of exposure such as marine atmospheres etc. unless approved measures are taken to protect the reinforcement from corrosion.

NOTES :-

1. For general notes refer Drawing No. BD/4-76.
2. Clear cover shall not be less than 40 mm for main reinforcement and 25 mm for other reinforcement unless specified otherwise.
3. Pre-cast spacer blocks of the strength not less than that of the concrete of girder, shall be provided as per the sketch to maintain the correct spacing of the main bars during concreting but these should not be placed at points of maximum Bending Moment.
4. Main beams shall be given upward camber to account for dead load deflection as given in the diagram.
5. For details of slab and schedule of reinforcement, quantities and reactions refer Drg. No. BD/4-76 and BD/6-76A respectively.
6. The expansion joints shall be of the approved type.
7. Two layers of mesh reinforcement type 'A' one at 20 mm and the other at 100 mm from the concrete surfaces shall be provided above the bearings. Similar mesh reinforcement of suitable size shall also be provided in the pier/abutment caps below the bearings.
8. The location of jacks for lifting up the superstructure to replace bearings etc. is shown thus ▲. These shall be distinctly etched on the cross girders and the pier/abutment caps. Mesh reinforcement type 'B' in two layers shall be provided in the girders and pier/abutment caps at jack positions at heights indicated in note 7 above.
9. The beam sections have been so proportioned that they permit use of modular shuttering which could be repeated easily for other spans.
10. The general arrangement of elastomeric bearings to be provided shall be as per Drawing No. BD/4-75B. Details of the elastomeric bearings for this design shall be as under. Tests and specification shall strictly comply with cl.2005(b) M.O.S & T. specification.
    i. Length (a) = 630 mm
    ii. Width (b) = 230 mm
    iii. No. of internal elastomeric layers = 4.
    iv. Overall thickness of bearings = 4 (10 + 3) + 2 x 3 = 61 mm.
    v. Design vertical load per bearing = 45 tonnes.
    vi. All dimensions are in millimetres.
12. For additional notes refer Drg. No. BD/6-76A.

NOTES:-

1. This drawing shall be read in conjunction with Drawing No. BD/13-76 and BD/14-76A showing the details of R.C.C. Deck Slab & R.C.C Girders respectively.
2. Full scale elevation for the bars shall be lined out on a plain plastered floor to the dimensions shown on the drawing so as to get correct clearance between different bars and then the bars bent up to proper shape.
3. Dimensions in the schedule are given as per IS:2502-1963.

ADDITIONAL NOTES FOR DRG. NO. BD/14-76A :

1. At the time of replacement of elastomeric bearings (whenever necessary), uniform seating of the main girders over the new bearings shall be ensured.
2. During jacking operation all the four jacks placed under one end x-girder shall be operated simultaneously using stress control system so as to ensure that the reactions on all the four jacks are equal at all times.
3. Maximum reactions on any jack under lifting condition = 21.6 tonnes.
4. Maximum design bearing pressure on sub-structure = 72 kg/cm².

MAXIMUM REACTIONS (IN TONNES)

At Abutment			At Pier		
DL	DL+LL	DL+LL+I	DL	DL+LL	DL+LL+I
87.00	157.00	170.90	174.00	256.25	272.70

TOTAL QUANTITIES (PER SPAN)

1. Steel: (including 5% extra for laps and wastage) = 10373 kgs.
2. Concrete: : 61.20 cu.m.

Note: These quantities do not include railing and wearing coat.

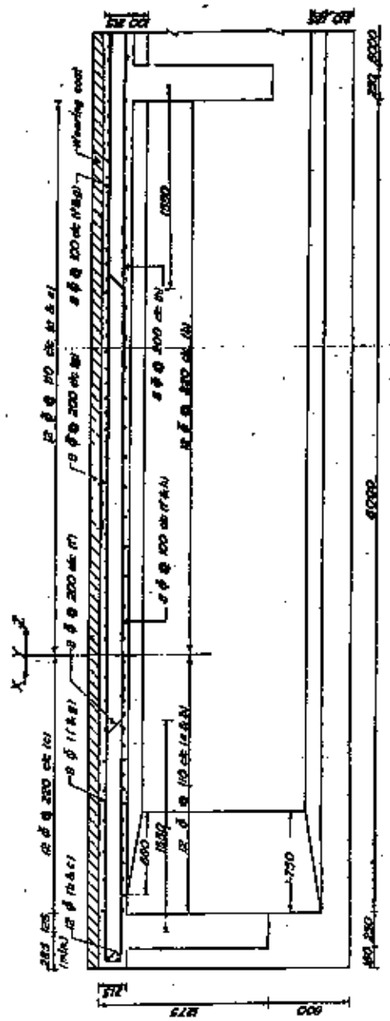
SECTION AT R-S
(SHOWING LOCAL VARIATION IN THE THICKNESS OF CANTILEVER SLAB AT THE ENDS)



LONGITUDINAL SECTION AT X-Y-Z

NOTES :-

1. The design is according to the following Bridge Codes : (i) IRC : 5-1970, (ii) IRC : 6-1966, (iii) IRC : 21-1972 with latest amendments.
2. All dimensions are in millimetres.
3. Concrete for both beams and slab shall have a minimum 28 days works crushing strength of 200 kg/cm² on 150 mm cubes.
4. Reinforcing steel used shall be High Yield Strength Deformed Bars conforming to IS : 1139-1966 [with latest amendments] or IS : 1786-1966 [with latest amendments].
5. This drawing shall not be applicable where reinforcing bars are joined by welding.
6. Joints or lapping of bars in main reinforcement shall be avoided as far as possible. However, the provision in clause No. 304.8.3. of IRC : 21-1972 should be strictly followed, if laps are provided.
7. Minimum cover to any reinforcement shall be 25 mm.
8. Pre-cast mortar blocks of the same strength as the slab concrete shall be used under the reinforcement to ensure the required cover.
9. Support Chairs of 12 ϕ bars shall be provided at suitable intervals.
10. Chamfers or fillets of sizes 25mm×25 mm shall be provided at all angles of the form work unless otherwise specified in the drawing.
11. The railings shall be of any approved type. The reinforcement from railing should be anchored in the kerb before casting the slab.
12. For details of wearing coat and drainage refer Drawing No. BD/1-69A.
13. Properly stiffened welded steel plates shall be used as shuttering.
14. This drawing shall be read in conjunction with following drawings :
    (i) BD/2-77A showing details of longitudinal girders.
    (ii) BD/3-77A showing details of cross girders
    (iii) BD/4-77A showing schedule of reinforcement.
15. This drawing shall not be used in unfavourable conditions of exposure such as marine atmosphere etc. unless approved measures are taken to protect the reinforcement from corrosion.

NOTES:

1. For General notes refer Drawing No. BD/1-77.
2. Clear cover shall not be less than 40 mm for main reinforcement and 25 mm for other reinforcement.
3. Pre-cast spacer blocks of the strength not less than that of the concrete of girder, shall be provided as per the sketch to maintain the correct spacing of the main bars during concreting but these should not be placed at points of maximum bending moments.
4. Main beams shall be given upward camber to account for dead load deflection as given in the diagram.
5. This drawing shall be read in conjunction with following.
   (i) Drawing No. BD/1-77 showing details of slab,
   (ii) Drawing No. BD/3-77 showing details of cross girders and
   (iii) Drawing No. BD/4-77A showing schedule of reinforcement.
6. The expansion joints shall be of the approved type.
7. Two layers of mesh reinforcement type 'A', one at 20 mm. and the other at 130 mm from the concrete surfaces shall be provided above the bearings. Similar mesh reinforcement of suitable size shall also be provided in the pier/abutment caps below the bearings.
8. The beam sections have been so proportioned that they permit the use of modular shuttering which could be repeated easily for other spans.
9. The general arrangement of elastomeric bearings to be provided shall be as per drawing No. BD/4-75. Details of the elastomeric bearings for this design shall be as under:
   i. Length (a) = 300 mm.
   ii. Width (b) = 320 mm.
   iii. Thickness of each internal elastomer layer = 12 mm.
   iv. Thickness of steel reinforcing plate = 3 mm.
   v. Overall thickness of bearings will be 84 mm.
   vi. No. of internal elastomeric layers = five.
   vii. Design vertical load (DL+LL+Impact) = 97 tonnes
   viii. Maximum design bearing pressure on sub-structure = 72 Kg/cm²
10. All dimensions are in millimetres.
11. This drawing shall not be applicable where reinforcing bars are joined by welding.
12. At the time of replacement of elastomeric bearings whenever necessary uniform seating of the main girders over the new bearings should be ensured.
13. Tests and specifications for elastomeric bearings shall comply with cl. 2005 of M.O.S. & T. specifications.

TOTAL QUANTITIES (PER SPAN)

1. STEEL = 14880 Kgs.
   (including 5% extra for laps and wastage.)
2. CONCRETE = 95.50 cum.
   Notes; These quantities do not include railing and wearing coat.

NOTES:

1. This drawing shall be read in conjunction with Drawing Nos. BD/5-77, BD/6-77 A and BD/7-77 A showing the details of RC.C.Deck slab, Longitudinal Girders and Cross Girders respectively.
2. Full scale elevation for the bars shall be lined out on a plain plastered floor to the dimensions shown on the drawing so as to get correct clearance between different bars and then the bars bent up to proper shape.
3. Dimensions in the schedule are given as per I.S. 2502-1963.

High Yield Strength Deformed Bars

NOTES :-

1. The design is according to the following Bridge Codes (i) IRC : 3-1970, (ii) IRC : 6-1966 & (iii) IRC : 21-1972 with latest amendments.
2. All dimensions are in millimetres.
3. Concrete for both beams and slab shall have a minimum 28 days works crushing strength of 200 kgs / cm² on 150 mm cubes.
4. Reinforcing steel used shall be High Yield Strength Deformed Bars conforming to IS : 1139-1966 (with latest amendments) or IS : 1786-1966 (with latest amendments).
5. This drawing shall not be applicable where reinforcing bars are joined by welding.
6. Joints or lapping of bars in main reinforcement shall be avoided as far as possible. However, the provision in clause No. 304.6.3 of IRC : 21-1972 should be strictly followed, if laps are provided.
7. Minimum cover to any reinforcement shall be 25 mm.
8. Pre-cast mortar blocks of the same strength as the slab concrete shall be used under the reinforcement to ensure the required cover.
9. Support bars of 12 mm dia. shall be provided at suitable intervals as per IS: 2502-63.
10. Chamfers or fillets of size 25 mm x 25 mm shall be provided at all angles of the form work unless otherwise specified in the drawing.
11. The railing shall be of any approved type. The reinforcement from railing should be anchored in the kerb before casting the slab.
12. For details of wearing coat and drainage refer Drawing No. BD/1-69A.
13. Properly stiffened steel plates shall be used as shuttering.
14. This drawing shall be read in conjunction with the following drawings :
    (i) BD/2-78A showing details of longitudinal girders
    (ii) BD/3-78A showing details of cross girders
    (iii) BD/4-78A showing schedule of reinforcement
15. This drawing shall not be used in unfavourable conditions of exposure such as marine atmosphere etc. unless approved measures are taken to protect the reinforcement from corrosion.

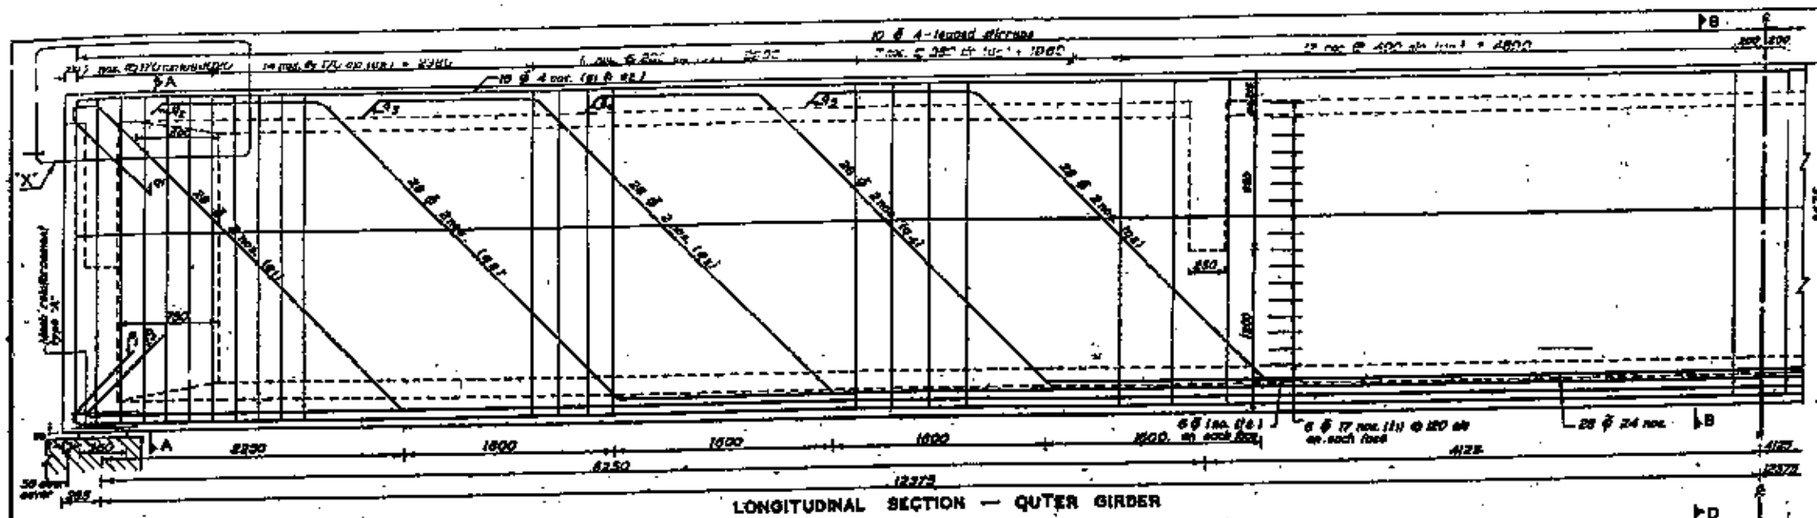
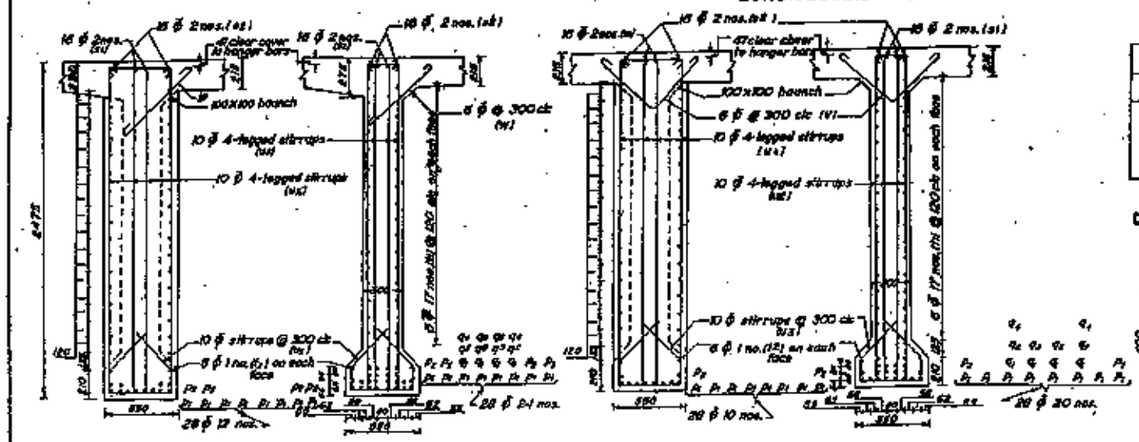
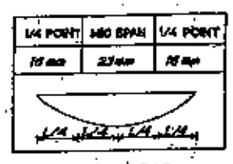
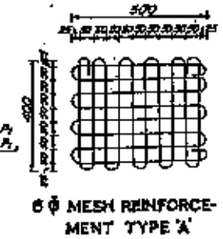
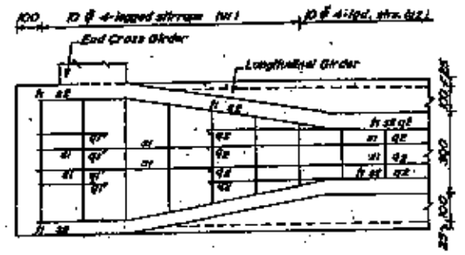
DRG. NO. BD/1-78.

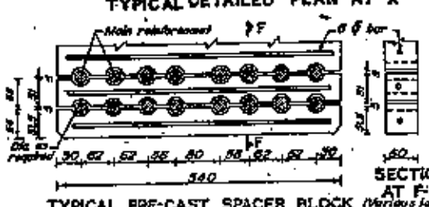












High Yield Strength Deformed Bar's

NOTES :-

1. For general notes refer Drawing No. BD/1-78.
2. Clear cover shall not be less than 40 mm for main reinforcement and 25 mm for other reinforcement.
3. Pre-cast spacer blocks of the strength not less than that of the concrete of girder, shall be provided as per the sketch to maintain the correct spacing of the main bars during concreting but these should not be placed at points of maximum bending moments.
4. Main beams shall be given upward camber to account for dead load deflection as given in the diagram.
5. This drawing shall be read in conjunction with following :
   (i) Drg. No. BD/1-78 showing details of slab.
   (ii) Drg. No. BD/3-78A showing details of cross girders.
   (iii) Drg. No. BD/4-78A showing schedule of reinforcement.
6. The expansion joints shall be of the approved type.
7. Two layers of mesh reinforcement type 'A' one at 20 mm and the other at 150 mm from the concrete surfaces shall be provided above the bearings. Similar mesh reinforcement of suitable size shall also be provided in the pier/abutment caps below the bearings.
8. The beam sections have been so proportioned that they permit the use of modular shuttering which could be repeated easily for other spans.
9. The general arrangement of elastomeric bearings to be provided shall be as per Drawing No. BD/4-78B. Details of the elastomeric bearings for this design shall be as under :
   i. Length (a) = 300 mm, ii. Width (b) = 350 mm
   iii. Thickness of each internal elastomer layer = 12 mm
   iv. Thickness of steel reinforcing plate = 3 mm,
   v. No. of internal elastomeric layers = six.
   vi Overall thickness of bearing = 99 mm.
   vii Design vertical load (DL+LL+ Impact) = 115 tonnes.
   viii Maximum design bearing pressure on sub-structure = 73 kg/cm².
10. All dimensions are in millimetres.
11. This drawing shall not be applicable where reinforcing bars are joined by welding.
12. At the time of replacement of elastomeric bearings (whenever necessary) uniform seating of the main girders over the new bearings should be ensured.
13. For revision table refer Drg. No. BD/4-78A
14. Tests and specifications for elastomeric bearings shall strictly comply with cl. 2003 of M.O.S. & T specification.

MESH REINFORCEMENT 6 mm TYPE 'B'

NOTES:

1. This drawing shall be read in conjunction with the following drawings.
   (i) BD/1-78 showing details of slab.
   (ii) BD/2-78 A showing details of longitudinal girders.
   (iii) BD/4-78 A showing schedule of reinforcement.
2. For general notes refer Drawings Nos. BD/1-78 and BD/2-78 A
3. The location of jacks for lifting up the superstructure to replace bearings etc. is shown thus ⇧ These shall be distinctly etched for easy identification on the cross girders and the pier/abutment caps. Mesh reinforcement type 'B' in two layers one at 20 mm and the other at 100 mm from the concrete surface shall be provided in the girders and the pier/abutment caps at jack positions.
4. During the jacking operation all the four jacks placed under one end cross girder shall be operated simultaneously using stress control system so as to ensure that the reaction on all the four jacks is equal at all times.
5. Maximum reaction on any jack under lifting condition = 40 Tonnes.
6. All dimensions are in millimetres.
7. This drawing shall not be applicable where reinforcing bars are joind by welding.
8. There shall be two intermediate cross girders provided at a spacing of 8.25 metres c/c

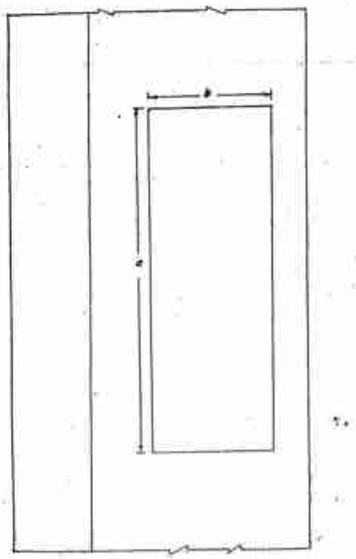
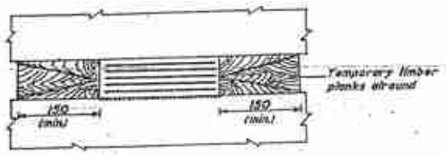
BEARING AT ABUTMENT

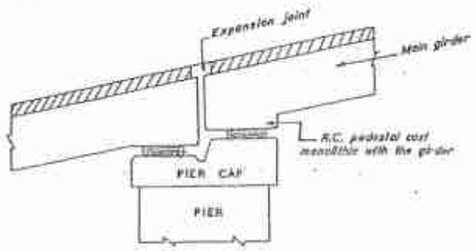
BEARINGS AT PIER



PLAN



TEMPORARY TIMBER PLANKS FOR INSTALLATION



INSTALLATION OF BEARINGS FOR SLOPING SUPER-STRUCTURE

INSTALLATION INSTRUCTIONS :

1. The position of the bearings shall be accurately marked on Pier / Abutment cap and the area where the bearings will be seated accurately levelled .
2. The concrete surface shall be freed from any loose material and cleaned of any grease , oil , paint etc . and it shall be dry at the time of fixing .
3. The surface of the elastomer shall be freed from any foreign matter , grease , oil , pant etc.
4. Once prepared , the concrete or elastomer surface should not be touched with bare hands.
5. Immediately after these have been placed in position the bearings shall be covered with canvas or a suitable covering material to protect from direct sun light and the weather until the concrete of the super-structure is cast .

6.1. The bearings shall be fixed in position with any approved type of epoxy resin adhesive . The instructions of adhesive manufacturer shall be scrupulously followed in fixing the bearings.

6.2. The concreting of girders shall be taken up only after ensuring that the adhesive for fixing the elastomeric bearings to the Pier / Abutment cap has set .

7. During concreting , the sides of bearings shall be covered with wooden planks as per sketch . These planks will be so placed that any load transfered to the bearings during concreting due to settlement of centering etc. shall be borne by the planks . The wooden planks should be supported by wedges in such a way that these can be easily removed after concreting of superstructure . Alternatively , any other suitable temporary support system approved by the Engineer-in-Charge may be adopted .
8. The side covering shall be removed after the superstructure concrete is set . The sides of the bearings shall be cleaned of any deposit of cement slurry / concrete .
9. At the time of replacement of bearings (whenever necessary), uniform seating of the main girders over all the new bearings shall be ensured .
10. BEARINGS FOR SLOPING SUPERSTRUCTURE :

The bearings shall be placed horizontally . The end portion of the girders above the bearings shall be made horizontal , adequately reinforced and cast monolithic with the girder so as to fit exactly above the bearings , as shown in the sketch .

NOTES :

1. Specifications including permissible tolerances for the Elastomeric Bearings shall be in accordance with clause 2005 of the Specifications for Road and Bridge Works (first revision) 1978 of the Ministry of Shipping & Transport (Roads Wing).
2. Elastomer (neoprene) to be used in bearings shall be of shore hardness of 60 .
3. The rotation due to constructional inaccuracy has not been considered in the design of the bearings . It is, therefore, essential that great care is exercised in placing the bearings accurately and installation instructions followed scrupulously . This is all the more important when the super-structure consists of pre-cast girders .
4. Elastomeric bearings should not be used in areas where the minimum temperature goes below (-) 10°c .
5. Thickness of any internal layer of elastomer shall be 10mm unless specified otherwise in the drawing .
6. The thickness of steel laminates shall not be less than 3 mm and the edges shall be rounded or chamfered . The steel shall conform to IS : 226 .
7. Bearings shall be handled carefully . These shall be protected from bright sun light and extreme cold . These shall be stored neatly under cover till used on the bridge.
8. All dimensions are in millimetres .
9. The bearings shall be tested in accordance with cl. 2005 of M.O. S&T specification before installation .

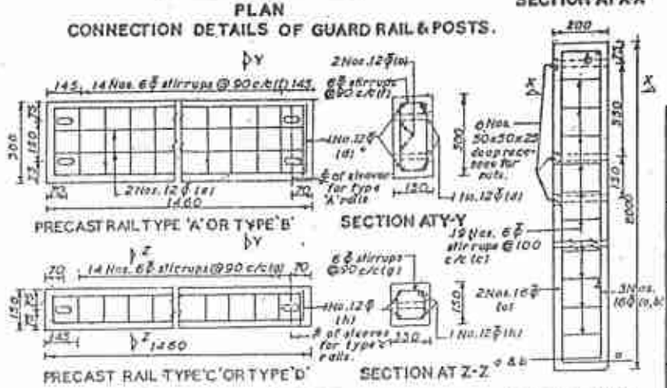
CONNECTION DETAILS OF GUARD RAIL & POSTS.



NOTES:

1. This drawing shows typical arrangement of approach connection to Highway Bridges along with guard rail system to be provided on the approaches.
2. For embankments of less than 3 metres height, provision of guard rails on approaches is not obligatory.
3. The proposed system is based on a precast rail length of 1.46 metres and maximum c/c spacing of 1.5 metres between posts.
4. The guard posts and rails shall be of precast concrete with a minimum 28 days works crushing strength of 200 Kgs/cm² on 150mm cubes.
5. Foundations of guard posts shall be in c.c. 1:2:4 cast-in-situ.
6. Steel reinforcement used shall be high yield strength deformed bars conforming to I.S:1139-66 or IS: 1786-66 with latest amendments.
7. Minimum cover to any reinforcement shall be 25mm.
8. All steel components such as sleeves, nuts, bolts & washers etc. shall conform to clause 1903 of M.O.S & T specification for Road and Bridge Works (1st. Revision 1978).
9. If the height of Bridge Railing is other than that indicated in this drawing, the arrangement may be suitably modified keeping the height of bottom rail same as indicated in this drawing and the top of the top guard rail flushing with the top of bridge railing.
10. The inside face of the guard rail shall be kept flush with inside face of the bridge railing/posts at the junction.
11. A strip of size 300mm x 100 mm on every lower guard rail shall be painted red with luminous paint as shown in this drawing.
12. For better visibility the guard rail system shall be painted either white or in a colour to match with the colour of bridge railing.
13. Soil around the posts shall be properly compacted after installation of the posts.
14. Proper care shall be taken in handling the precast components, in order to avoid any damage.
15. Foundation concrete shall be laid only after fixing the rail to the posts, and holding the posts in position by suitable temporary supporting system.
16. The temporary supporting system shall be removed only after the foundation concrete has properly set and earth back filled.
17. All dimensions are in millimetres.

NOTES :-

1. This drawing shows typical arrangement of approache connection to Highway Bridges along with guard rail system to be provided on the approaches.
2. For embankments of less than 3 metres height, provision of guard rails on approaches is not obligatory.
3. The proposed system is based on a precast rail length of 1.46 metres, and maximum c/c spacing of 1.5 metres between posts.
4. The guard posts and the rails shall be of precast concrete with a minimum 28 days works crushing strength of 200 kgs./cm² on 150 mm cubes.
5. Foundations of guard posts shall be in c.c. 1:2:4 cast-in-situ.
6. Steel reinforcement used shall be High Yield Strength Deformed Bars conforming to IS: 1139-66 or IS: 1786-66 with latest amendments.
7. Minimum cover to any reinforcement shall be 25 mm
8. All steel components such as sleeves, nuts, bolts and washers etc. shall conform to clause 1903 of M.O.S&T specification for Road and Bridge Works (Ist. revision 1978).
9. If the height of Bridge Railing is other than that indicated in this drawing, the arrangement may be suitably modified keeping the height of bottom rail same as indicated in this drawing and the top of the top guard rail flushing with the top of the bridge railing.
10. The inside face of the guard rail shall be kept flush with inside face of the bridge railing/posts at the junction.
11. A strip of size 500 x 100 mm on every lower guard rail shall be painted red with a luminous paint as shown in this drawing.
12. For better visibility the guard rail system shall be painted either white or in a colour to match with the colour of bridge railing.
13. Soil around the posts shall be properly compacted after installation of the posts.
14. Proper care shall be taken in handling the precast components in order to avoid any damage.
15. Foundation concrete shall be laid only after fixing the rails to the posts, and holding the posts in position by suitable temporary supporting system.
16. The temporary supporting system shall be removed only after the foundation concrete has properly set and earth back-filled.
17. All dimensions are in millimetres.

FOREWORD

I have great pleasure in placing before the community of Bridge Engineers, this Volume of Standard Plans for Highway Bridges covering RCC right slab type superstructure. This publication is the first in the series of new Standard Plans for Highway Bridge Superstructure being brought out keeping in view the recent changes in specifications and provisions in the Bridge Codes. I am sure this publication will prove extremely useful in proper planning, estimation and execution of highway bridges in the country.

The publication has been made possible by the sustained efforts of the personnel of the Bridges Standards and Research zone of the Bridges Directorate of this Ministry and the Consultant associated with the work, who deserve commendation for the work done by them. The keen interest of the Addl. Director General (Bridges), in taking up this work and bringing out this publication in a short time is worthy of special mention.

(K.K. SARIN)
Director General (Road Development) &
Addl. Secretary to the Govt. of India

New Delhi, June 1, 1991

ANO: 2-956

PREFACE

The Standard Plans for Highway Bridges with RCC Slab Type Superstructure (Volume II) were first issued by the Ministry of Surface Transport (Roads Wing) in the year 1977. Since then there have been several revisions in the specifications and provisions of the Bridge Codes. The preparation of revised Standard Drawings, therefore, taken up towards the end of 1989 and completed on top priority.

This Volume, the first in the series of new Standard Drawings for Superstructure, contains Standard Plans for RCC Slab type highway bridge superstructure for 3.0 to 10.0 metre effective spans. It also contains drawings for wearing coat, railings and miscellaneous items. A separate volume containing bill of quantities for various items of superstructures will also be issued shortly.

The design caters for one lane of IRC Class 70-R wheeled/tracked loading or 2-lanes of IRC Class A loading whichever produces more severe effect. Footpaths have been designed for a crowd load of 5 kN/m². Keeping in view the current practice of providing a deck of the same width as the adjoining road for NH bridges having total length less than 30 m, the overall width between the outer faces of the railing kerb has been kept as 12 m. The wearing coat will be of mastic and asphaltic concrete type, except in remote areas where average 75 mm thick cement concrete wearing coat may also be adopted. The designs are based on Standard Specifications and Codes of Practice for Highway Bridges issued by the Indian Roads Congress. For construction purposes, Specifications for Road and Bridge works issued by the Govt. of India, Ministry of Surface Transport (Roads Wing), as amended from time to time, will apply.

The plans have been made complete in all respects so that they could be readily adopted for preparation of estimates and also serve as construction drawings in the field. The entire design philosophy adopted lays great emphasis on constructability i.e. convenient and full translation of the design on to the ground. A great deal of attention has, therefore, been paid to dimensioning and detailing. I have no doubt that the wide spread adoption of these Standard Plans will lead to reduction in time of construction and enhancement of the quality and durability of our road bridges.

Every possible care has been taken to eliminate errors in the Drawings but users are requested to bring to our notice errors or omissions, if any, which may come to light while using these Drawings in their bridge works.

The work of preparing the Designs and Drawings was carried out by the Consultant, M/s. Consulting Engineering Services (India) Pvt. Ltd., New Delhi. Equally important contributions in the finalisation of the designs and details were made by officers of the Ministry whose names appear in the title blocks of various drawings. The enthusiasm and dedication which they brought to bear on the task are to be highly appreciated.

(NINAN KOSHI)
Addl. Director General (Bridges),
Ministry of Surface Transport (Roads Wing)

New Delhi, June 1, 1991

(A) GENERAL

1. These notes are applicable for the Standard Drawings for R.C.C. solid slab superstructure with and without footpaths.
2. These drawings are applicable only for right bridges with overall width of 12 m.
3. No raised footpaths shall be provided on the bridges having length less than 30m unless the same are otherwise existing on the approaches.
4. All dimensions are in millimetres unless otherwise mentioned. Only written dimensions are to be followed. No drawing shall be scaled.
5. Design criteria:
   I. The design is according to the following codes:
      (a) IRC : 5-1985
      (b) IRC : 6-1966 (1985 reprint)
      (c) IRC : 21-1987.
   II. The following loads have been considered in the design:
      (a) One lane of IRC class 70R or two lanes of IRC class A on carriage way, whichever governs.
      (b) Footpath load of 5 kN/sq.m for superstructure having footpaths.
      (c) Wearing coat load of 2 kN/sq.m.
   III. The designs are applicable for 'MODERATE' AND 'SEVERE' conditions of exposure.
6. Public utility services (except water supply and sewerage), if required, shall be carried over the bridge through 150mm diameter ducts provided in the footpaths. Total load of such services shall not be more than 1.0 kN per metre on each footpath. Water/sewerage pipeline shall not be carried over any part of the superstructure. Inspection chambers in footpaths may be provided as shown in the drawing. The location and spacing of chambers along the footpath will be decided by the Engineer-in-charge in consultation with the users.
7. Wearing coat shall consist of the following:
   I.(a) A coat of mastic asphalt 6mm thick with a prime coat over the top of the deck before the wearing coat is laid. The prime coat of mastic asphalt shall be 30% straight run 30/40 penetration grade bitumen and 59% light solvent (Benzol) to be laid over the deck slab. The insulating layer of 6mm thick mastic asphalt with 75% lime stone dust filler and 25% of 30/40 penetration grade bitumen shall be laid at 375°F with broom over prime coat.
   (b) 50mm thick asphaltic concrete wearing coat in two layers of 25mm each as per Clause 512 of MOST's Specifications for Road and Bridge Works (Second Revision-1988)
   II. In case of isolated bridge construction or bridges located in remote areas where provision of mastic and asphaltic concrete wearing coat is not practicable, the Engineer-in-charge may permit provision of 75mm thick cement concrete wearing coat in M30 grade concrete with maximum water cement ratio as 0.40. The reinforcement shall consist of 6mm High Yield Strength Deformed bars @ 200mm centres reducing to 100 centres in both the directions over a strip of 300mm near the expansion joint. Reinforcement shall be placed at the centre of the wearing coat. Wearing coat shall be discontinued at expansion joint locations. Joint fillers shall extend upto the top of wearing coat.
8. 20mm expansion joint does not cater for any allowance for possible tilting of abutment.
9. Support for the deck slab shall provide a bearing width of 400mm.
10. In urban areas, chequered tiles may be provided in the footpath portion by suitably adjusting the thickness of the footpath slab.
11. Type/position of return walls, railings, guard posts, ramp etc. in approach portion shall be decided by the Engineer-in-charge.

(B) MATERIALS SPECIFICATIONS :

Concrete

1. Concrete shall be of design mix and shall have minimum 28 days characteristic strength on 150mm cubes for all elements of superstructure as indicated below;

Conditions of exposure	Concrete grade	Characteristic Strength
'MODERATE'	M 25	25 MPa (for 3m to 9m span)
'MODERATE'	M 30	30 MPa (for 10m span)
'SEVERE'	M 30	30 MPa (for 3m to 10m span)

2. High strength ordinary portland cement conforming to IS:8112 or ordinary portland cement conforming to IS 269 capable of achieving the required design concrete strength shall only be used.
3. The minimum cement content and maximum water cement ratio in the concrete design mix shall be 310 kg/cu.m and 0.45 respectively for 'MODERATE' conditions of exposure. The minimum cement content and maximum water cement ratio in the concrete design mix shall be 400 kg/cu.m and 0.40 respectively for 'SEVERE' conditions of exposure.

Reinforcement

All reinforcing bars shall be High Yield Strength Deformed bars (Grade designation S 415) conforming to IS 1786.

Water

Water to be used in concreting and curing shall conform to Clause 302.4 of IRC 21-1987.

(C) WORKMANSHIP/DETAILING

1. Minimum clear cover to any reinforcement including stirrups shall be 50mm unless shown otherwise in the drawings.
2. For ensuring proper cover of concrete to reinforcement bars specially made polymer cover blocks shall only be used.
3. Construction Joints
   I. The location and provision of construction joints shall be approved by Engineer-in-charge. The concreting operation shall be carried out continuously upto the construction joint.
   II. concrete surface at the joint shall be brushed with a stiff [illegible] after casting while the concrete is still fresh and it has only partly hardened.
   III. Before new concrete is poured the surface of old concrete shall be prepared as under:
      a) For hardened concrete, the surface shall be thoroughly cleaned to remove debris/laitance and made rough so that 3/4 of the size of the aggregate or structurally damaging the concrete.
      b) For partially hardened concrete, the surface shall be treated by wire brush followed by an air jet.
      c) The old surface shall be soaked with water without leaving puddles immediately before starting concreting to prevent the absorption of water from new concrete.
   IV. New concrete shall be thoroughly compacted in the region of the joint.
4. Welding of reinforcement bars shall not be permitted.
5. Laps in reinforcement:
   I. Minimum lap length of reinforcement shall be kept as 83 d where 'd' is the diameter of bar.
   II. Not more than 50% of reinforcement shall be lapped at any one location.
6. Bending of reinforcement bars shall be as per IS : 2502.
7. Supporting chairs of 12mm diameter shall be provided at suitable intervals as per IS : 2502.
8. Concrete shall be produced in a mechanical mixer of capacity not less than 200 litres having integral weigh-batching facility and automatic water measuring and dispensing device.
9. Proper compaction of concrete shall be ensured by use of full width screed vibrators for concrete in deck slab.
10. Properly braced steel plates shall be used as shuttering.
11. Sharp edges of concrete shall be chamfered.

(D) GENERAL SPECIFICATIONS

The work shall be executed in accordance with MOST's Specification for Road and Bridge Works (Second Revision, 1988) except wherever otherwise mentioned.

GOVERNMENT OF INDIA
MINISTRY OF SURFACE TRANSPORT
(ROADS WING), NEW DELHI

STANDARD DRAWINGS FOR ROAD BRIDGES

R.C.C. SOLID SLAB SUPERSTRUCTURE (RIGHT) SPAN 10·0m

(WITHOUT FOOTPATHS)

RECOMMENDED BY		APPROVED BY	1990.
(S.S. REDDY) E.E.	(S.K. KAISTHA) S.E.	(P.K. SHIVAPRASAD) C.E.	DRG. NO SD/114

(A) GENERAL

1. These notes are applicable for the Standard Drawings for R.C.C. solid slab superstructure with and without footpaths.

2. These drawings are applicable only for skew bridges with overall right width of 12 m.

3. No raised footpaths shall be provided on the bridges having length less than 30 m measured along skew direction unless the same are otherwise existing on the approaches.

4. All dimensions are in millimetres unless otherwise mentioned. Only written dimensions are to be followed. No drawing shall be scaled.

5. Design criteria:

   I. The design is according to the following codes:

      (a) IRC:5-1985

      (b) IRC:6-1966 (1985 reprint)

      (c) IRC:21-1987.

   II. The following loads have been considered in the design:

      (a) One-lane of IRC class 70R or two lanes of IRC class A on carriageway, whichever governs.

      (b) Footpath load of 5 kN/sq.m for superstructure having footpaths.

      (c) Wearing coat load of 2 kN/sq.m.

   III. The designs are applicable for 'MODERATE AND SEVERE' conditions of exposure.

6. Public utility services (except water supply and sewerage), if required, shall be carried over the bridge through 150 mm diameter ducts provided in the footpaths. Total load of such services shall not be more than 1.0 kN per metre on each footpath. Water/sewerage pipeline shall not be carried over any part of the superstructure. Inspection chambers in footpaths may be provided as shown in the drawing. The location and spacing of chambers along the footpath will be decided by the Engineer-in-charge in consultation with the users.

7. Wearing coat shall consist of the following:

   I. (a) A coat of mastic asphalt 6 mm thick with a prime coat over the top of the deck before the wearing coat is laid. The prime coat of mastic asphalt shall be 30 per cent straight run 30-40 penetration grade bitumen and 50 per cent light solvent (Benzol) to be laid over the deck slab. The insulating layer of 25 mm thick mastic asphalt with 75 per cent lime stone dust filler and 25 per cent of 30/40 penetration grade bitumen shall be laid at 375°F with broom over prime coat.

      (b) 50 mm thick Bituminous Concrete wearing coat in two layers of 25 mm each as per Clause 509 of MoRT&H's Specifications for Road and Bridge Works (Fourth Revision 2001)

   II. In case of isolated bridge construction or bridges located in remote areas where provision of mastic and asphaltic concrete wearing coat is not practicable, the Engineer-in-charge may permit provision of 75 mm thick reinforced cement concrete wearing coat in M30 grade concrete with maximum water cement ratio as 0.40. The reinforcement shall consist of 8 mm High Yield Strength Deformed bars @200 mm centres. However, in the 300 mm width adjacent to expansion joint the reinforcement shall comprise 8 mm dia HYSD bars spaced at 100 mm centre-to-centre in both directions.

8. Wearing coat shall be discontinued at expansion joint locations. Joint fillers shall extend upto the top of wearing coat.

9. Width of expansion joint has been kept 20 mm only which does not cater for any allowance for possible tilting of abutment.

10. Support for the deck slab shall provide a bearing width of 400 mm measured in a direction perpendicular to support.

11. In urban areas, chequered tiles may be provided in the footpath portion by suitably adjusting the thickness of the footpath slab.

12. Type/position of return walls, railings, guard posts, ramp etc. in approach portion shall be decided by the Engineer-in-charge.

(B) MATERIALS SPECIFICATIONS

Concrete

1. Concrete shall be design mix shall have minimum 28 days characteristic strength of 30 MPa on 150 mm cubes for all elements of superstructure for both 'SEVERE' and 'MODERATE' conditions of exposure.

2. Ordinary portland cement conforming to IS:269 or high strength ordinary portland cement conforming to IS:8112 capable of achieving the required design concrete strength shall only be used.

3. The minimum cement content and maximum water cement ratio in the concrete design mix shall be 310 kg/cu.m. and 0.45 respectively for 'MODERATE' conditions of exposure. The minimum cement content and maximum water cement ratio in the concrete design mix shall be 400 kg/cu.m. and 0.40 respectively for 'SEVERE' conditions of exposure.

Reinforcement

All reinforcement bars shall be High Yield Strength Deformed bars (Grade designation S 415) conforming to IS:1786.

Water

Water to be used in concreting and curing shall conform to Clause 302.4 of IRC:21-1987.

(C) WORKMANSHIP/DETAILING

1. Minimum clear cover to any reinforcement including stirrups shall be 50 mm unless shown otherwise in the drawings.

2. For ensuring proper cover of concrete to reinforcement bars specially made polymer cover blocks shall only be used.

3. Construction joints

   I. The location and provision of construction joints shall be approved by the Engineer-in-charge. The concreting operation shall be carried out continuously upto the construction joint.

   II. The concrete surface at the joint shall be brushed with a stiff brush after casting while the concrete is still fresh and it has only slightly hardened.

   III. Before new concrete is poured the surface of old concrete shall be prepared as under:

   a) For hardened concrete, the surface shall be thoroughly cleaned to remove debris/laitance and made rough so that 1/4 of the size of the aggregate is exposed but without dislodging the aggregate or structurally damaging the concrete.

   b) For partially hardened concrete, the surface shall be treated by wire brush followed by an air jet.

   c) The old surface shall be soaked with water without leaving puddles immediately before starting concreting to prevent the absorption of water from new concrete.

   IV. New concrete shall be thoroughly compacted in the region of the joint.

4. Welding of reinforcement bars shall not be permitted.

5. Laps in reinforcement:

   I. Minimum lap length of reinforcement shall be kept as 83 d where 'd' is the diameter of bar.

   II. Not more than 50 per cent of reinforcement shall be lapped at any one location.

   III. For closely spaced bars lapping may be avoided by providing suitable type of mechanical splices.

6. Bending of reinforcement bars shall be as per IS:2502.

7. Supporting chairs of 12 mm diameter shall be provided at suitable intervals as per IS:2502.

8. Concrete shall be produced in a mechanical mixer of capacity not less than 200 litres having integral weigh-batching facility and automatic water measuring and dispensing device.

9. Proper compaction of concrete shall be ensured by use of full width screed vibrators for concrete in deck slab.

10. Properly braced steel plates shall be used as shuttering.

11. Sharp edges of concrete shall be chamfered.

(D) GENERAL SPECIFICATIONS

The work shall be executed in accordance with MoRT&H's Specifications for Road and Bridge Works (Fourth Revision, 2001) except wherever otherwise mentioned.

(E) For details refer MoRT&H's Standard Drawings as listed below:

R.C.C. SOLID SLAB SUPERSTRUCTURE (SKEW) RIGHT EFFECTIVE SPAN 4.0 m TO 10.0 m (WITH AND WITHOUT FOOTPATHS) GENERAL NOTES

(A) GENERAL

1. These notes are applicable for the Standard Drawings for R.C.C. solid slab superstructure with and without footpaths.
2. These drawings are applicable only for right bridges with overall width of 12 m.
3. No raised footpaths shall be provided on the bridges having length less than 30 m unless the same are otherwise existing on the approaches.
4. All dimensions are in millimetres unless otherwise mentioned. Only written dimensions are to be followed. No drawing shall be scaled.
5. Design criteria:
   - I. The design is according to the following codes:
     - (a) IRC:5-1985
     - (b) IRC:6-1966 (1985 reprint)
     - (c) IRC:21-1987.
   - II. The following loads have been considered in the design:
     - (a) One lane of IRC class 70R or two lanes of IRC class A on carriageway, whichever governs.
     - (b) Footpath load of 5 kN/sq.m for superstructure having footpaths.
     - (c) Wearing coat load of 2 kN/sq.m.
   - III. The designs are applicable for 'MODERATE AND SEVERE' conditions of exposure.
6. Public utility services (except water supply and sewerage), if required, shall be carried over the bridge through 150 mm diameter ducts provided in the footpaths. Total load of such services shall not be more than 1.0 kN per metre on each footpath. Water/ sewerage pipeline shall not be carried over any part of the superstructure. Inspection chambers in footpaths may be provided as shown in the drawing. The location and spacing of chambers along the footpath will be decided by the Engineer-in-charge in consultation with the users.
7. Wearing coat shall consist of the following:
   - I. (a) A coat of mastic asphalt 6 mm thick with a prime coat over the top of the deck before the wearing coat is laid. The prime coat of mastic asphalt shall be 30 per cent straight run 30/ 40 penetration grade bitumen and 50 per cent light solvent (Benzol) to be laid over the deck slab. The insulating layer of 6 mm thick mastic asphalt with 75 per cent lime stone dust filler and 25 per cent of 30/40 penetration grade bitumen shall be laid at 375°F with broom over prime coat.
     - (b) 50 mm thick asphaltic concrete wearing coat in two layers of 25 mm each as per Clause 512 of MoRT&H's Specifications for Road and Bridge Works (Second Revision, 1988)
   - II. In case of isolated bridge construction or bridges located in remote areas where provision of mastic and asphaltic concrete wearing coat is not practicable, the Engineer-in-charge may permit provision of 75 mm thick cement concrete wearing coat in M 30 grade concrete with maximum water cement ratio as 0.40. The reinforcement shall consist of 8 mm High Yield Strength Deformed bars @200 mm centres reducing to 100 centres in both the directions over a strip of 300 mm near the expansion joint. Reinforcement shall be placed at the centre of the wearing coat. Wearing coat shall be discontinued at expansion joint locations. Joint fillers shall extend upto the top of wearing coat.
8. 20 mm expansion joint does not cater for any allowance for possible tilting of abutment.
9. Support for the deck slab shall provide a bearing width of 40 mm.
10. In urban areas, chequered tiles may be provided in the footpath portion by suitably adjusting the thickness of the footpath slab.
11. Type/position of return walls, railings, guard posts, ramp etc. in approach portion shall be decided by the Engineer-in-charge.

(B) MATERIALS SPECIFICATIONS

Concrete

1. Concrete shall be of design mix and shall have minimum 28 days characteristic strength on 150 mm cubes for all elements of superstructure as indicated below:

Conditions of exposure	Concrete grade	Characteristic Strength
'MODERATE'	M 25	25 MPa (for 3 m to 9 m span)
'MODERATE'	M 30	30 MPa (for 10 m span)
'SEVERE'	M 30	30 MPa (for 3 m to 10 m span)

2. High strength ordinary portland cement conforming to IS:8112 or ordinary portland cement conforming to IS:269 capable of achieving the required design concrete strength shall only be used.
3. The minimum cement content and maximum water cement ratio in the concrete design mix shall be 310 kg/cu.m and 0.45 respectively for 'MODERATE' conditions of exposure. The minimum cement content and maximum water cement ratio in the concrete design mix shall be 400 kg/cu.m and 0.40 respectively for 'SEVERE' conditions of exposure.

Reinforcement

All reinforcing bars shall be High Yield Strength Deformed bars (Grade designation S 415) conforming to IS:1786.

Water

Water to be used in concreting and curing shall conform to Clause 302.4 of IRC:21-1987.

(C) WORKMANSHIP/DETAILING

1. Minimum clear cover to any reinforcement including stirrups shall be 50 mm unless shown otherwise in the drawings.
2. For ensuring proper cover of concrete to reinforcement bars specially made polymer cover blocks shall only be used.
3. **Construction Joints**
   - I. The location and provision of construction joints shall be approved by Engineer-in-charge. The concreting operation shall be carried out continuously upto the construction joint.
   - II. The concrete surface at the joint shall be brushed with a stiff brush after casting while the concrete is still fresh and it has only slightly hardened.
   - III. Before new concrete is poured the surface of old concrete shall be prepared as under:
     - a) For hardened concrete, the surface shall be thoroughly cleaned to remove debris/laitance and made rough so that 1/4 of the size of the aggregate or structurally damaging the concrete.
     - b) For partially hardened concrete, the surface shall be treated by wire brush followed by an air jet.
     - c) The old surface shall be soaked with water without leaving puddles immediately before starting concreting to prevent the absorption of water from new concrete.
   - IV. New concrete shall be thoroughly compacted in the region of the joint.
4. Welding of reinforcement bars shall not be permitted.
5. Laps in reinforcement:
   - I. Minimum lap length of reinforcement shall be kept as 83 d where 'd' is the diameter of bar.
   - II. Not more than 50 per cent of reinforcemen be lapped at any one location.
6. Bending of reinforcement bars shall be as per IS
7. Supporting chairs of 12 mm diameter shall be pr at suitable intervals as per IS:2502.
8. Concrete shall be produced in a mechanical mi capacity not less than 200 litres having integral w batching facility and automatic water measurin dispensing device.
9. Proper compaction of concrete shall be ensured l of full width screed vibrators for concrete in deck
10. Properly braced steel plates shall be used as shutt
11. Sharp edges of concrete shall be chamfered.

(D) GENERAL SPECIFICATIONS

The work shall be executed in accordance MoRT&H's Specification for Road and Bridge V (Fourth Revision, 2001) except wherever othe mentioned.

(E) For details refer MORT&H's Standard Dra as listed below:

PLAN

DETAILS OF DRAINAGE SPOUT

SCHEDULE OF REQUIREMENTS

WEARING COAT (CEMENT CONCRETE) (PER METRE LENGTH)		WEARING COAT (ASPHALTIC CONCRETE) (PER METRE LENGTH)		EXPANSION JOINT (PER JOINT)		DRAINAGE SPOUT (PER SPOUT)	
1. CONCRETE	0·0675	1. ASPHALTIC CONCRETE	0·039 cu.m.	1. ANGLES 1.S.A. 75x75x6 75 MM LONG	2 NOS.	1. 6 MM PLATE	0·065 Sq.M.
2. M.S. REINFORCEMENT IN WEARING COAT (a) ϕ 6 BARS @ 200 c/c IN BOTH DIRECTIONS.	15 Kg.			2. FLAT IRON 140 x 6 x 35 M.	150 GMS.	2. FLAT IRON 12 x 4 x 0	0·33 M.
(b) ϕ 6 BARS @ 100 c/c IN BOTH DIRECTION	30 Kg.			3. 12 ϕ ANCHOR BARS - 356 LONG	200 GMS.	3. 100 ϕ DRAIN SPOUT (LENGTH TO SUIT)	1 NO.
				4. 12 ϕ BOLTS WITH NUTS	2 NOS.		

THIS SCHEDULE IS FOR A CLEAR ROADWAY OF 7·5 m

8. THE SEALING COMPOUND SHALL BE POURED IN THE JOINT ON THE TOP OF THE FILLER AFTER CLEANING THE JOINT BY THE HELP OF COMPRESSED AIR.

GENERAL NOTES:-

CONCRETE — CONCRETE IN WEARING COAT SHALL HAVE A MINIMUM 28 DAYS WORKS CUBE STRENGTH OF 160 kg/cm² ON 150 mm CUBES.

REINFORCEMENT — MILD STEEL REINFORCEMENT SHALL CONFORM TO THE LATEST I.S. 432 GRADE I TESTED STEEL.

STRUCTURAL STEEL — STRUCTURAL STEEL SECTIONS SHALL CONFORM TO THE LATEST I.S. 226.

ASPHALTIC CONCRETE — SHALL CONFORM TO ANY APPROVED SPECIFICATION.

NOTES:-

1. THE LONGITUDAL AND TRANSERSE CAMBERS SHALL BE ACHIEVED AS SUGGESTED IN THE SUPER-STRUCTURE DRAWING.
2. THE CAMBER TO BE PROVIDED IN THE CASE OF CEMENT CONCRETE & ASPHALTIC CONCRETE WEARING COAT SHALL BE 1:75 AND 1:60 RESPECTIVELY.
3. THE SPACING OF DRAINAGE SPOUTS SHALL NOT BE MORE THAN 10 METERS.
4. THE DRAINAGE SPOUTS SHALL BE GALVANISED AFTER WELDING THE PLATES TO-GETHER.
5. THE DETAILS OF EXPANSION JOINT WILL HOLD GOOD FOR TOTAL EFFECTIVE EXPANDABLE LENGTHS (IN THE CASE OF SIMPLY SUPPORTED SPANS WITH FREE BEARINGS ON THE SAME PIER THE TOTAL EFFECTIVE LENGTH WILL BE TWICE THE SPAN LENGTH) UPTO 80 METERS IN THE CASE OF BRIDGES IN EXTREME CLIMATE LOCALITIES AND 115 METERS IN THE CASE OF BRIDGES IN MODERATE CLIMATE LOCALITIES.
6. THE DIMENSIONS AND SIZES OF COMPONENTS INDICATED IN THE DRAWING ARE IN MILLIMETERS UNLESS INDICATED OTHERWISE.
7. FIXING OF EXPANSION JOINT ASSEMBLY IN THE GAP SPECIALLY LEFT SHOULD BE DONE WITH CARE. SPECIAL CARE SHALL BE TAKEN IN COMPACTING THE CONCRETE IN THIS GAP TO SEE THAT NO HOLLOWS ARE LEFT BEFORE LAYING WEARING COAT THE EXPANSION JOINT ASSEMBLY SHOULD BE CHECKED FOR EFFICIENT FUNCTIONING.
8. THE SEALING COMPOUND SHALL BE POURED IN THE JOINT ON THE TOP OF THE FILLER AFTER CLEANING THE JOINT BY THE HELP OF COMPRESSED AIR.

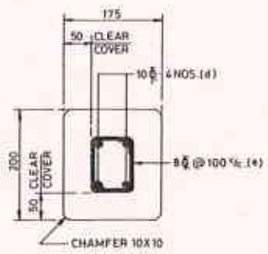
ELEVATION



SECTION - A. A

NOTES

1. Centre to centre spacing between successive vertical posts shown in the elevation shall be adjusted to suit the length of bridge span for which the railing is used but in no case it shall exceed 1870 mm.
2. Reinforcement of railing post should be suitably anchored in deck slab.
3. Casting of post shall be done in single pour after accurately positioning the precast handrail.
4. Railing shall be constructed only after the structural concrete of superstructure has hardened and shuttering is released.
5. In case other type of railing is used the weight of same on each side shall not exceed 3 KN per metre.
6. Expansion gaps in railing shall be provided at the same locations as in the deck slab.
7. This drawing is to be read in conjunction with following drawing.
   i) General notes .... Drg. No. SD/ 200.

18·00	500	360	96	5	6	12	4	6	6	M 30

INSTALLATION INSTRUCTIONS

1. Care shall be taken in packing, transportation, storage and handling to avoid any mechanical damage, contamination with oil, grease and dirt, undue exposure to sunlight and weather.
2. The bearings shall be placed in a recess as shown in the drawing.
3. The position of the bearings shall be accurately marked on pier/ abutment cap and the area where the bearings will be seated accurately levelled.
4. The concrete surface shall be free from any loose material and cleaned of any grease, oil, paint etc. and it shall be dry at the time of fixing of bearing. The surface shall be sand blasted, clean of all laitance and levelled true.
5. Bearings must be placed between true horizontal surfaces (maximum tolerance 0·2 per cent perpendicular to load) and at true plan position of their control lines marked on receiving surfaces (maximum tolerance ± 3 mm). Concrete surfaces shall be free from local irregularities (maximum tolerance ± 1 mm in height).
6. Where bearings are installed prior to its concreting, the forms around the bearings shall be soft enough for easy removal. Forms shall also fit the bearings snugly and prevent any leakage of mortar grout. Any mortar contaminating the bearings during concreting shall be completely removed before setting.
7. The temporary forms shall be removed after the superstructure concrete has set. The sides of the bearings shall be cleaned of any deposit of cement slurry / concrete.

MAINTENANCE

1. The bearings shall be subjected to planned maintenance care.
2. The exposed bearing surface shall be maintained clean and free from contamination with grease or oil, etc.
3. Annual routine maintenance inspection or special maintenance inspection of all bearings shall be made to check for any surface cracking or signs of damage, deterioration or distress.
4. Damaged bearings shall be replaced immediately. To avoid differences in stiffness, all adjacent bearings on the same line of support shall also be replaced and uniform seating of the main girders over all the new bearings shall be ensured.
5. Procedure of jacking of girders shall be as indicated in notes of the cross girder drawing.

NOTES

1. Specifications including permissible tolerances for the Elastomeric Bearings shall be in accordance with IRC:83 (part II) 1987 standard specifications and code of practice for Road Bridges Section IX part II- Elastomeric Bearings.
2. The design of elastomeric bearings is applicable to the bridges in the zone indicated below (Refer. cl. 222 of IRC:6-1966(1985 Reprint).

Zones	Applicability to bridges
I and II	all bridges
III and IV	all bridges up to total length of 60 m.
III and IV [where Horizontal seismic co-efficient $(\alpha\beta\lambda) \leq 0{\cdot}075$]	bridges more than 60 m length.

3. Raw Material : Chloroprene (CR) shall only be used in manufacture of bearings.
- 3·1 Grades of raw elastomer of proven use in elastomeric bearings, with low crystallisation rates and adequate shelf life (e.g. Neoprene WRT, Bayprene 110 or equivalent) shall be used. No reclaimed rubber or vulcanised wastes shall be used. The raw elastomer content of the compound shall not be lower than 60 per cent. The ash content shall not exceed 5 per cent. (As per tests conducted in accordance with ASTM D-297).EPDM and other similar candidate elastomers for bridge bearing use shall not be permitted.
4. Fabrication, testing and acceptance of bearings shall be in accrodance with IRC: 83 (part II) 1987.
5. Elastomeric bearings should not be used in areas where the minimum temperature goes below (−) 10°C.
6. Bearings shall be handled carefully. These shall be protected from bright sun light and extreme cold. These shall be stored neatly under cover till installation.
7. This drawing shall be read in conjunction with drg. nos.
   i, General notes.... Drg. No. SD/200
   ii, Drawings for General Arrangement, Details of longitudenal girders and Details for cross girders for the corresponding spans.
8. Bearings shall be procured only from prequalified manufactures.

TYPICAL DETAIL OF CONNECTION OF DRAINAGE SPOUT WITH BULB OF GIRDERS

NOTES

1. All dimensions are in millimetres.
2. The details shown in this drawing are applicable for R.C.C T-Beam slab Superstructure with and without footpaths.
3. Material specifications and workman-ship shall be in accordance with MOST Specifications for Road and Bridge works (2nd revision 1988) unless stated otherwise in this drawing or drawing No. SD/200
4. Wearing coat shall consist of the following
   a) A coat of mastic asphalt 6mm thick, with a prime coat over the top of the deck before the wearing coat is laid. The prime coat of mastic asphalt shall be 30% straight run 30/40 penetration grade betumen and 50% light solvent (Benzol) to be laid over the deck slab. The insulating layer 6mm thick Mastic asphalt with 75% lime stone dust filler and 25% of 30 to 40 penetration grade bitumen shall be laid at 375°F with broom over prime coat
   b) 50 mm thick asphatic concrete wearing coat in two layers of 25mm each as per clause No 512 of MOST Specification for Road and Bridge works (2nd revision 1988).
5. In case of isolated bridge construction or bridges located in remote areas where provision of mastic and asphalt concrete wearing coat is not practicable, the Engineer in charge may permit provision of 75 mm thick cement concrete wearing coat in M 30 grade concrete as shown in the drawing
6. Spacing of drainage spout in different spans will be as shown in the general arrangement drawing of the corresponding spans.
7. Drainage spout and collection pit assembly shal be fabricated from mild steel and after fabricatio the complete assembly expect grating shall be given a hot dipped galvanised coating.
8. The fixing clamps will be of hot dipped galvanise M S flat.
9. Mimimum number of clamps to be provided with vertical drainage spout for fixing to longitudinal girders shall be two.
10. Reinforcement in wearing coat will be placed at the centre of the wearing coat.

STANDARD DRAWINGS FOR ROAD BRIDGES

R.C.C. T-BEAM AND SLAB SUPERSTRUCTURE WITH AND WITHOUT FOOTPATHS DETAILS OF MISCELLANEOUS ITEMS

RECOMMENDED BY		APPROVED BY	DRG. NO.
(M. P. MARWAH) S.E.	(N.K. SINHA) S.E.	(ZHA HURNERJEE) C.E.	SD/ 205

(A) GENERAL

1. These notes are applicable for the Standard Drawings for R.C.C. solid slab superstructure with and without footpaths.
2. These drawings are applicable only for right bridges with overall width of 12 m.
3. No raised footpaths shall be provided on the bridges having length less than 30 m unless the same are otherwise existing on the approaches.
4. All dimensions are in millimetres unless otherwise mentioned. Only written dimensions are to be followed. No drawing shall be scaled.
5. Design criteria:
   I. The design is according to the following codes:
      (a) IRC:5-1985
      (b) IRC:6-1966 (1985 reprint)
      (c) IRC:21-1987.
   II. The following loads have been considered in the design:
      (a) One lane of IRC class 70R or two lanes of IRC class A on carriageway, whichever governs.
      (b) Footpath load of 5 kN/sq.m for superstructure having footpaths.
      (c) Wearing coat load of 2 kN/sq.m.
   III. The designs are applicable for 'MODERATE AND SEVERE' conditions of exposure.
6. Public utility services (except water supply and sewerage), if required, shall be carried over the bridge through 150 mm diameter ducts provided in the footpaths. Total load of such services shall not be more than 1.0 kN per metre on each footpath. Water/ sewerage pipeline shall not be carried over any part of the superstructure. Inspection chambers in footpaths may be provided as shown in the drawing. The location and spacing of chambers along the footpath will be decided by the Engineer-in-charge in consultation with the users.
7. Wearing coat shall consist of the following:
   I. (a) A coat of mastic asphalt 6 mm thick with a prime coat over the top of the deck before the wearing coat is laid. The prime coat of mastic asphalt shall be 30 per cent straight run 30/ 40 penetration grade bitumen and 50 per cent light solvent (Benzol) to be laid over the deck slab. The insulating layer of 6 mm thick mastic asphalt with 75 per cent lime stone dust filler and 25 per cent of 30/40 penetration grade bitumen shall be laid at 375°F with broom over prime coat.
      (b) 50 mm thick asphaltic concrete wearing coat in two layers of 25 mm each as per Clause 512 of MoRT&H's Specifications for Road and Bridge Works (Second Revision, 1988)
   II. In case of isolated bridge construction or bridges located in remote areas where provision of mastic and asphaltic concrete wearing coat is not practicable, the Engineer-in-charge may permit provision of 75 mm thick cement concrete wearing coat in M 30 grade concrete with maximum water cement ratio as 0.40. The reinforcement shall consist of 8 mm High Yield Strength Deformed bars @200 mm centres reducing to 100 centres in both the directions over a strip of 300 mm near the expansion joint. Reinforcement shall be placed at the centre of the wearing coat. Wearing coat shall be discontinued at expansion joint locations. Joint fillers shall extend upto the top of wearing coat.
8. 20 mm expansion joint does not cater for any allowance for possible tilting of abutment.
9. Support for the deck slab shall provide a bearing width of 40 mm.
10. In urban areas, chequered tiles may be provided in the footpath portion by suitably adjusting the thickness of the footpath slab.
11. Type/position of return walls, railings, guard posts, ramp etc. in approach portion shall be decided by the Engineer-in-charge.

(B) MATERIALS SPECIFICATIONS

Concrete

1. Concrete shall be of design mix and shall have minimum 28 days characteristic strength on 150 mm cubes for all elements of superstructure as indicated below:

Conditions of exposure	Concrete grade	Characteristic Strength
'MODERATE'	M 25	25 MPa (for 3 m to 9 m span)
'MODERATE'	M 30	30 MPa (for 10 m span)
'SEVERE'	M 30	30 MPa (for 3 m to 10 m span)

2. High strength ordinary portland cement conforming to IS:8112 or ordinary portland cement conforming to IS:269 capable of achieving the required design concrete strength shall only be used.
3. The minimum cement content and maximum water cement ratio in the concrete design mix shall be 310 kg/cu.m and 0.45 respectively for 'MODERATE' conditions of exposure. The minimum cement content and maximum water cement ratio in the concrete design mix shall be 400 kg/cu.m and 0.40 respectively for 'SEVERE' conditions of exposure.

Reinforcement

All reinforcing bars shall be High Yield Strength Deformed bars (Grade designation S 415) conforming to IS:1786.

Water

Water to be used in concreting and curing shall conform to Clause 302.4 of IRC:21-1987.

(C) WORKMANSHIP/DETAILING

1. Minimum clear cover to any reinforcement including stirrups shall be 50 mm unless shown otherwise in the drawings.
2. For ensuring proper cover of concrete to reinforcement bars specially made polymer cover blocks shall only be used.
3. **Construction Joints**
   I. The location and provision of construction joints shall be approved by Engineer-in-charge. The concreting operation shall be carried out continuously upto the construction joint.
   II. The concrete surface at the joint shall be brushed with a stiff brush after casting while the concrete is still fresh and it has only slightly hardened.
   III. Before new concrete is poured the surface of old concrete shall be prepared as under:
      a) For hardened concrete, the surface shall be thoroughly cleaned to remove debris/laitance and made rough so that 1/4 of the size of the aggregate or structurally damaging the concrete.
      b) For partially hardened concrete, the surface shall be treated by wire brush followed by an air jet.
      c) The old surface shall be soaked with water without leaving puddles immediately before starting concreting to prevent the absorption of water from new concrete.
   IV. New concrete shall be thoroughly compacted in the region of the joint.
4. Welding of reinforcement bars shall not be permitted.
5. Laps in reinforcement:
   I. Minimum lap length of reinforcement shall be kept as 83 d where 'd' is the diameter of bar.
   II. Not more than 50 per cent of reinforcemen be lapped at any one location.
6. Bending of reinforcement bars shall be as per IS
7. Supporting chairs of 12 mm diameter shall be pr at suitable intervals as per IS:2502.
8. Concrete shall be produced in a mechanical mi capacity not less than 200 litres having integral w batching facility and automatic water measurir dispensing device.
9. Proper compaction of concrete shall be ensured l of full width screed vibrators for concrete in decl
10. Properly braced steel plates shall be used as shutt
11. Sharp edges of concrete shall be chamfered.

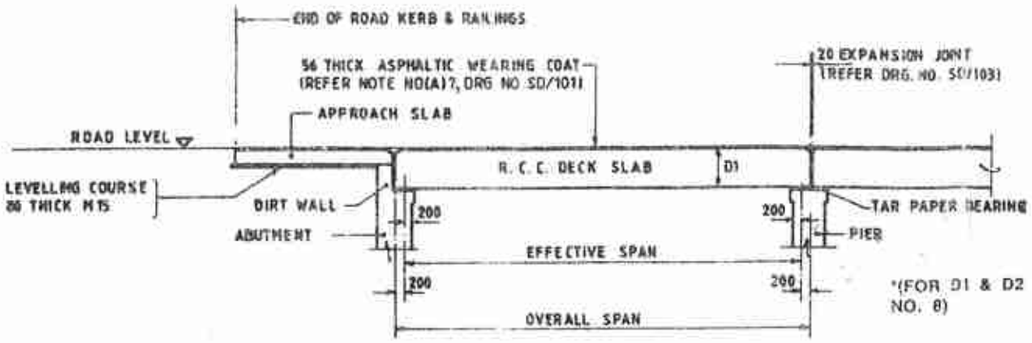
(D) GENERAL SPECIFICATIONS

The work shall be executed in accordance MoRT&H's Specification for Road and Bridge V (Fourth Revision, 2001) except wherever othe mentioned.

(E) For details refer MORT&H's Standard Dra as listed below:

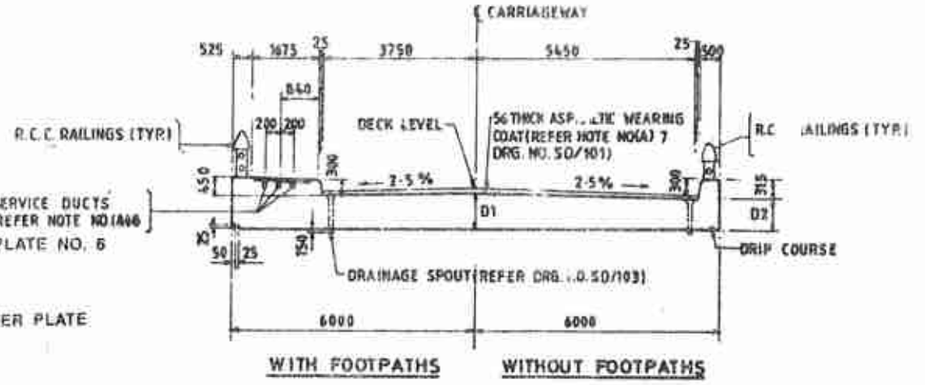
Drawing No.	Title
SD/102	General Arrangement
SD/103 & SD/104	Miscellaneous Details
SD/105	Details of R.C.C. Raili (without footpaths)
SD/106	Details of R.C.C. Railings (foot-paths)
SD/107 through SD/114	R.C.C. solid slab superstructure (right) Spans 3 m to 10 m (without footpaths)
SD/115 through SD/122	R.C.C. solid slab superstructure (right) Spans 3 m to 10 m (with footpaths)

R.C.C. SOLID SLAB SUPERSTRUCTURE (RIGHT) EFFECTIVE SPAN 3.0 m TO 10.0 m (WITH AND WITHOUT FOOTPATHS) GENERAL NOTES

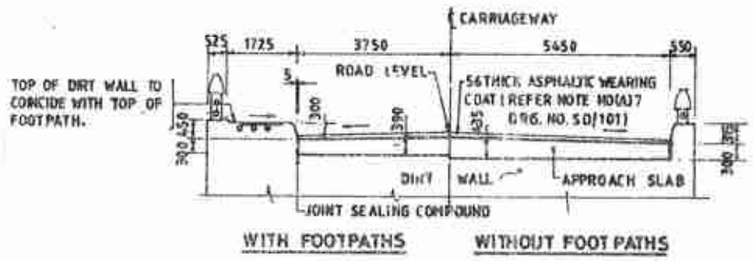


SECTION A-A

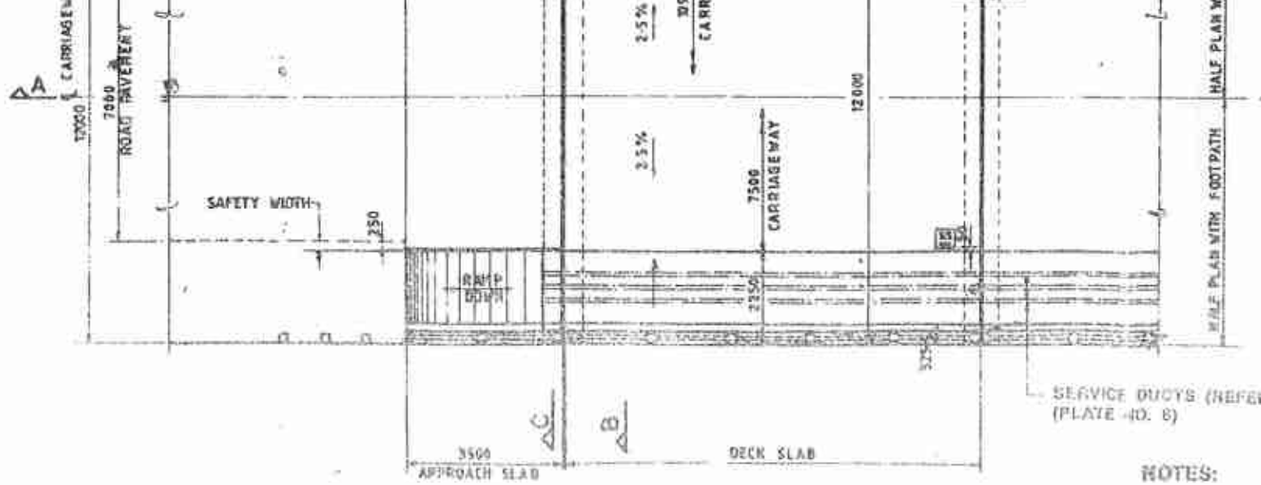
(ROAD KERB & RAILINGS NOT SHOWN.)



SECTION B-B



SECTION C-C



PLAN

NOTES:

1. All dimensions are in millimetres unless otherwise mentioned. Only written dimensions are to be followed.
2. Typical arrangement of drainage spouts has been shown in plan. Suitable modifications may be made by the Engineer-in-charge as per site conditions and intensity of rainfall.
