

Lipo HiFu Black Bella DC™

- High Intensity Focused Ultrasound (HIFU) uses ultrasound energy in the subcutaneous tissue to heat targeted area under skin to reduce fat cells and to stimulate new collagen regeneration. The LipoHiFu probe disrupts adipose (fat), lifts and tightens the skin on the abdomen, flanks, back, thighs, arms, neck, and improves lines and wrinkles on the décolleté.
- Bella HiFu is a non-invasive procedure for those not ready for surgery, and can also be an aesthetic option to extend the effects of cosmetic surgery.
- Fat reduction begins the metabolic process within hours after the first treatment and exits the body by way of lymphatic drainage. Vibration therapy accompanies the treatment at BlackBellaDC. Additional physical activity, hydration and/or detox are recommended to speed and improve fat reduction results. 2-3 treatments are recommended depending upon the area and condition of the zone to be treated.
- An initial skin firming effect shows right after the treatment, but the real skin tightening results appear over 2-3 months. For most people, one treatment can last 2-3 years. For people with high laxity, two times may be needed for favorable results.

***consultation is required.
