

Care guide

Ball python

Congratulations on your new pet!

Here are some quick tips to get you started on the right track. Tip #1 even though you really want to, try to let your pet settle in and get use to you. So give them about a week or until two days after their first successful feeding before handling. Tip # 2 all our snakes are started on frozen thawed rodents. This has all the nutrients they need and it's what they're use to so it'll make the transition easier. Final tip, when you do start handling your snake it's all about building a relationship. Building threads of trust and become that really comfortable place for your snake to hangout and explore their new world. We strongly recommend not cohabiting these animals.

What you need:

- Heat pad
- Thermostat
- hide is beneficial
- Water dish
- substrate

Setup:

- Ideal temperature 88 to 90 degrees
- Medium to high humidity (60 - 70%)

Disclaimer: This sheet is just what works for us it isn't the only way to keep your animal.
