Commercial power plant saves millions

Residential Fixed Monthly Electricity Bill \$38.50

Technology: Energy—New power plant design produces electricity at low-cost.

Miller Clean Production

Miller Energy is a recently established energy-producing power plant company that focuses on customer cost savings. As a privately owned entity, we utilize unique proprietary technology to supply electricity to households for a fixed monthly electrical bill savings of 75%.

We serve communities by forming a cooperative, which is established through investments from

individual households. Each cooperative serves between 8,000 and 15,000 households and is powered by a newly constructed Yireh motor power plant. The process is that simple!

Startup & Environmentally Safe

Miller Energy has successfully completed a pioneering procedure that has never before been carried out in the energy industry. This new business successfully utilized the scaled compact force model to torque a rotor. While our energy product is noncarbon, recyclable, and nonhazardous, we do what no other energy producer has done.

How Much to build a power plant—as Little as \$239.48

The monthly electrical bill will be set in the U.S. at \$38.50. The investment for the Miller Energy consists of 15,000 households, requiring an investment of \$239.48 in the USA from each household in the supply grid.

Investing households would receive a return on their investment plus 20% interest after the first and second tax year of service. The monthly bill would remain at \$38.50, with no rate increases except for a possible yearly inflation index of no more than 3%. Small businesses with 200-amp service or less may be classified as residential service. Conversely, larger businesses may not be eligible to apply for ME residential service. However, CEOs may inquire about the possibility of constructing a power plant for your company. If a country builds one power plant at \$4 million, Miller Energy will energize the rest of the country at no charge with the same low-cost.

Yireh Motor a Technical Wonder Changing the world.

The Yireh motor represents a groundbreaking power plant innovation in energy production. This single motor replaces the traditional equipment found in conventional power plants, such as turbines, pipelines, generators, and other machinery. Yireh power plants, developed by the Miller Energy, require no additional fuel for 80 years, leading to a remarkable 75% reduction in monthly electrical bills for consumers, and 90% reduction in power plant construction costs.
