cleangold[®] products

At first glance, one might dismiss the power of these simple looking tools, but Cleangold has been independently tested and proven to be a unique solution to an age-old problem: how to separate fine gold, platinum and other minerals of commerce from black sands, magnetite, and other heavy minerals without using mercury or other toxins.

Substitution of Cleangold for mercury is not only an environmental and health benefit, but is an economic boost as well. Independent laboratory and field testing showed Cleangold outperformed mercury on gold particles below 60 microns. The miner's return on investment for Cleangold equipment is typically less than three weeks.
