

1000Base 2CH Compact BiDi SFP Transceiver

Product Features

- Achieve operational compatibility with conventional SFP: Conventional SFP will function when plugged into a C-SFP socket. No damage to C-SFP and host board if C-SFP module is plugged into a conventional SFP socket
- 2-channel Bi-directional Optical Transceiver unit with
 - 1490nm DFB Laser diode transmitter
 - 1310nm InGaAs PIN photodiode receiver
- 2xBi-directional transceivers in 1 SFP transceiver package
- 20-pin electrical interface and LC receptacle ,With pull de-latch
- 1250Mbps Typical Data Rate and compliant to 1000Base IEEE802.3ah
- Comply with CSFP MSA Option 2
- Digital diagnostic monitoring
- Metal enclosure for lower EMI
- +3.3V Single power supply
- LVPECL logic interface simplifies interface to external circuitry
- 10 km reach with 9/125 μm single mode fiber (SMF)
- Operation case temperature : 0 to 70° C
- Comply with RoHS directive (2002/95/EC)

Applications

- Gigabit Ethernet
- Point to Point FTTH Application

The optical transceiver is compliant with the Compact Small Form-Factor Pluggable (CSFP) Multi-Source Agreement (MSA) option 2. It offers previously unavailable system cost, upgrade, and reliability benefits by virtue of being hot-pluggable.

Notes:

1. TX_disable1, 2 are an input that is used to shut down the transmitter optical output. It is pulled up within the module with a 4.7 – 10 K Ω resistor. Its states are:

Low (0 – 0.8V): Transmitter on

(>0.8, < 2.0V): Undefined

High (2.0 – 3.47V): Transmitter Disabled Open: Transmitter Disabled

2. Mod-Def 1, 2. These are the module definition pins. They should be pulled up with a 4.7K – 10K Ω resistor on the host board. The pull-up voltage shall be VccT or VccR.

Mod-Def 1 is the clock line of two wire serial interfaces for serial ID Mod-Def 2 is the data line of two wire serial interface for serial ID

3. VEE may be internally connected within the SFP module.

4. RD1, 2-/+ : These are the differential receiver outputs. They are AC coupled 100 Ω differential lines which should be terminated with 100 Ω (differential) at the user SERDES. The AC coupling is done inside the module and is thus not required on the host board.

5. VccT,VccR are the power supplies. They are defined as 3.3V \pm 5% at the SFP connector pin. Maximum supply current is 450mA@3.3V. Vcc may be internally connected within the SFP transceiver module.

6. TD1, 2-/+ : These are the differential transmitter inputs. They are AC-coupled, differential lines with 100 Ω differential termination inside the module. The AC coupling is done inside the module and is thus not required on the host board.

7. LOS1,2 (Loss of Signal) is an open collector/drain output, which should be pulled up with a 4.7K – 10K Ω resistor. Pull up voltage between 2.0V and VccT, R+0.3V. When high, this output

indicates the received optical power is below the worst-case receiver sensitivity (as defined by

the standard in use). Low indicates normal operation. In the low state, the output will be pulled to < 0.4V.

8. TX Fault report transceiver status as following:

TX Fault is an open collector/drain output, which should be pulled up with a 4.7K – 10K Ω resistor on the host board. Pull up voltage between 2.0V and VccT, R+0.3V. When high, output indicates a laser fault of some kind either in Channel 1 or Channel 2. The Host shall read Channel 1/2: A2H/AAH: 110 for details: TX Fault from channel 1 if bit 2 is set in [A2H:110]; TX Fault from channel 2 if bit 2 is set in [B2H: 110]. Low indicates normal operation. In the low state, the output will be pulled to < 0.8V.
