

OCC Outdoor Grow Suggestions

Outdoor cannabis growing is a whole different beast than growing cannabis indoor. Here's a simple grow method we suggest for Oklahoma home growers:

1 - Pick your location carefully

Make sure that this location gets as much sun as possible on your property. South facing hills are the best! Watch where the sun comes up on your property and where it sets. Make sure there are no structures that block the sun in those spots. If your plants always start flowering early when you put them out, then you might need to add supplemental lighting an hour (or more) each day. We suggest getting your plants outside May 1st - June 1st. The earlier you get them outside, the bigger they will get.

2 - Start with at least a 35 gallon cloth pot

The rule is, the bigger the pot, the bigger the plant. If you want a big one like commercial growers grow in California, use a a 100-300 gallon cloth pot.

If you place the pot on the bare ground, the roots will most likely go into the ground. Some people don't like that, but we have no issue with it unless you have gophers. If you don't want your roots to go in the ground, put the pot on a tarp, a pallet, or on the cement.

3 - Pick your soil, but use a heavier soil than you use indoor

Indoor soil is too light, and will dry out too fast and not retain enough water during those hot Oklahoma days. {PLEASE DO NOT USE MIRACLE GROW!!!} Soil is expensive, but you can find cheaper soil or make your own blend using what you have in your yard.

There is a ton of information online on how to make your own soil. We suggest "living soils," so try searching for that, or "super soil," or "Coot's mix." Make sure to add mycorrhizae into your soil mix. You can always add more in your teas and top dressings. Add beneficial nematodes.

EXTRA: Look into Horizontal Soil System and use 1-3" rocks at the bottom for extra drainage. Then a layer of sand about 2x higher. Next pour your soil. Leave 3-4 inches or so at the top for extra top dressings, etc.

4 - Transplant your clone

#1 thing to remember is timing here. Wait until nighttime, once the sun is almost down at least. Dig an appropriate sized hole and transplant your clone. Give it a nice heavy watering and saturate the pot.
