Contents

1. System Overview

Module	Sensor Type	Thermopile far-infrared sensor
	Available Spectrum	8~14um
	Resolution	32（H）x 32（V）
	Pixel Size	90um
	Maximum Frame Rate	7 FPS
	Typical Target Temp.	35~39℃
	Target Temp. Range	0~300℃
	Maximum Temp. Range	0~300℃
Environment	Working Environment Temp.	0~50℃
	Storage Environment Temp.	0~50℃
Interface	Power Supply	USB 5.0V （ ±10% ）
	Power Consumption	200mW（Typical）
	Signal Interface	USB/UART
	Output	RGB（Image）/Temp. Array
Layout	Size	34.4 x 20 x 10.1 (mm)
	FOV（Field Of View）	33°
2. Mechanical Specification
3. Interface Description

3.1. UART/HUART Interface

Default Interface: UART

Baud rate: 115200

Data: 8bit   Parity: none

Stop: 1bit   Flow control: none

CMD List:

Output Command:

VCMD=$COMMAND {In Hex: 0x56434D443D_____}

Acknowledgement:

data [0A]

| AMT (Ambient Temp.)	DAT (Temp. Array)	RES (Resolution)
TMP (Display Temp.)	VER (Firmware Version)	CFT (Continuous Frame Trans Before Compensation.)
OPW (Display Temp on Screen)	RXX (To get all pixels in row x)	CXX (To get all pixels in column x)
LFH (Point location of forehead)	FHT (get forehead temperature)	GYF (Get gray image within 8-bit)
BDHC (Border High Limit change)	BDLC (Border Low Limit change)	OHT (Outside high temp)
BDWH (Border Weight and Height setting)	IRT (IR Camera direction setting)	IRL (IR Camera direction setting)
DTB (Data Block)	IRR (IR Camera direction setting)	IRB (IR Camera direction setting)
OFFS (Point location of Forehead offset setting)	CENT (FHT Center Coordinate Setting)	

Notes: if you want to get the temperature of particular point, following method may work. All operations should be done during AMCAP working to watch the image normally, just to ensure temperature data available.

Command: *VCMD1_____ to VCMD1024.*

Only 4 characters could be import after the *VCMD*. After "1" have 3 spaces and the display temperature data output at 10 times Celsius.

E.g.: If you want to get the temp. of the 123rd pixel, you can input *VCMD123_* and there is a space in the end. If you read the data correctly and translate it from Hex into Decimal, for example you get 368 finally, that means you get the point temperature 36.8℃.
AMT: you can send this command if you want to get the Ambient Temp. The length of data you had received is 28 bytes, which head is *Ambient Temperature=* and Ambient Temp data is displayed in HEX.

DAT: this function is used for output serial frames. In this model, you can get single frame of data after you send this command. All data is received in HEX. The header of frame is 53 54 41 52 54 and the end of frame is 53 54 4F 50. The length of the data receive is about 2057 bytes.

RES: return Hestia's sensor resolution. Length of data: 21 bytes
TMP: the function is for user to get Length of data: 88 bytes
```
AvgTmp=0x00E4
Max=0x0101
Min=0x00C1
Extremum=0x0040
Ambient Temperature=0x198
```

stop
```

50.
Notes: the header frame is expressed in hex as 0x53 54 41 52 54 and the end frame is expressed in hex as 0x53 54 4F 50.

The command demo could be like picture on right.

OPW: It will display **CENTER-TEMP**/**Ambient-TEMP**/**MAX-TEMP**/**MIN-TEMP** on Screen for Users when it was turned on

E.g.: It will display four basic temperature on each corner of the screen while it was turned on (As shown on the right side)
GYF: 8bit Gray Frame image will sent after you send this command. Length of data: 3585 bytes
Notes: if you want to get temperature in particular column/row. It may works:
Command: VCMD=C01
You could import the number of column/row to get pixels in the number that sent

E.g.: if you want to get all pixels in row 11rd, just sent command VCMD=R11 and receive it in Hex
LFH: send this command to point position of forehead and save into flash. It only can recognize the point over 50℃ and save it.
Success in return **"Done"**

E.g.:

```
[14:01:40.021]OUT→◇VCMD=LFH□
[14:01:40.232]IN←◆Done
```

ClearData OpenFile | Ser

◉ CloseCom ↻   More Settings | ☑ Show Time and Packe OverTim
□ RTS □ DTR BaudRat 115200 ▼ | VCMD=LFH

FHT: it will return temperature of the point you had saved. Save about 50 num of data and correct output automatically. Length of Data: 26 bytes

E.g.:

```
[14:10:19.674]OUT→◇VCMD=FHT□
[14:10:19.727]IN←◆Forehead Temperature:370
```
ClearData OpenFile | Se

◉ OpenCom ↻   More Settings | ☑ Show Time and Packe OverTim
□ RTS □ DTR BaudRat 115200 ▼ | VCMD=FHT

OHT: This Function will open the Outside Ambient Temp Compensation to correct temperature when it changed. Length of data:21 Bytes

E.g.:

```
[16:35:43.850]发→◇VCMD=OHT|
□
[16:35:43.896]收←◆outside_high_temp=0
```

```
清除窗口  打开文件                              发送文件
端口号 COM3 Silicon Labs CP210x U ▼  □ HEX显示  保存数据  □ 接收数据到
```

BDHC: it will change the maximum limit in Forehead Temperature Correction

BDLC: it will change the minimum limit in Forehead Temperature Correction

Forehead Temperature Correction:
When the temperature locate between minimum temperature limit and maximum temperature limit, it will calculate it and output more humanity

IRB/IRT/IRR/IRL: This model is use to confirm the IR Camera install direction which is use for detection area rotate

E.g.: please choose corresponding situation and send the command

IRT

IRL   IRR

IRB
```
[16:37:29.071]发→◇VCMD=IRB
□
[16:37:29.119]收←◆IRButtom
```

BDWH: you can change the detecting area of command VCMD=FHT while using this command.
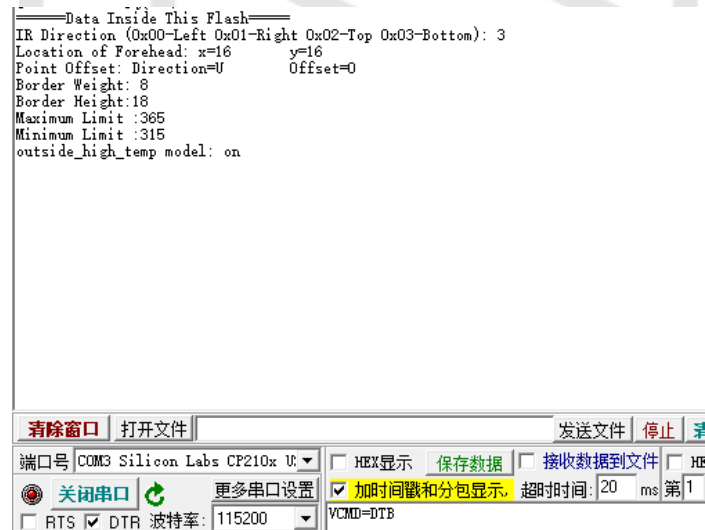

E.g.: input the head of command :**BDWH**, and follow four digits. First and twice digits represent the width of the area, and the last two numbers represent the height of the area

```
[14:31:54.135]发→◇BDWH0816
□
[14:31:54.323]收←◆Border-size: weight:8 height:16
```

DTB: it will read your settings and print them out.

E.g.:

```
════Data Inside This Flash════
IR Direction (0x00-Left 0x01-Right 0x02-Top 0x03-Bottom): 3
Location of Forehead: x=16        y=16
Point Offset: Direction=U        Offset=0
Border Weight: 8
Border Height:18
Maximum Limit :365
Minimum Limit :315
outside_high_temp model: on
```

OFFS: if you are satisfied with the area you had set and just want to translate the matrix to get further match. Use it.

E.g.: input the head of command :**OFFS=**, and follow the direction of translation(**U**P/**D**OWN/**L**EFT/**R**IGHT). Input the step you want to move,and send it.

CENT: we update another way to set the coordinate of FHT center point if needed

E.g.: input the head of command :**CENT**, and follow four digits. First and twice digits represent the X coordinate of the area, and the last two numbers represent the Y coordinate of the point
The data will save into flash after you receive the information from Hestia.

FHT-Detecting area setting:

Step1:

Comfirm the IR Camera install direction and Send command.

IRT

IRL   IRR

IRB

Step2:

Set the detecting area by using command BDWH and follow the weight and height you want to.

For example: **BDWH0816** means that the weight of area is 8px and the height of area is 16px.

Step3:

Put High Temperature object(over 50℃) into the area, and move it to the place you interest.
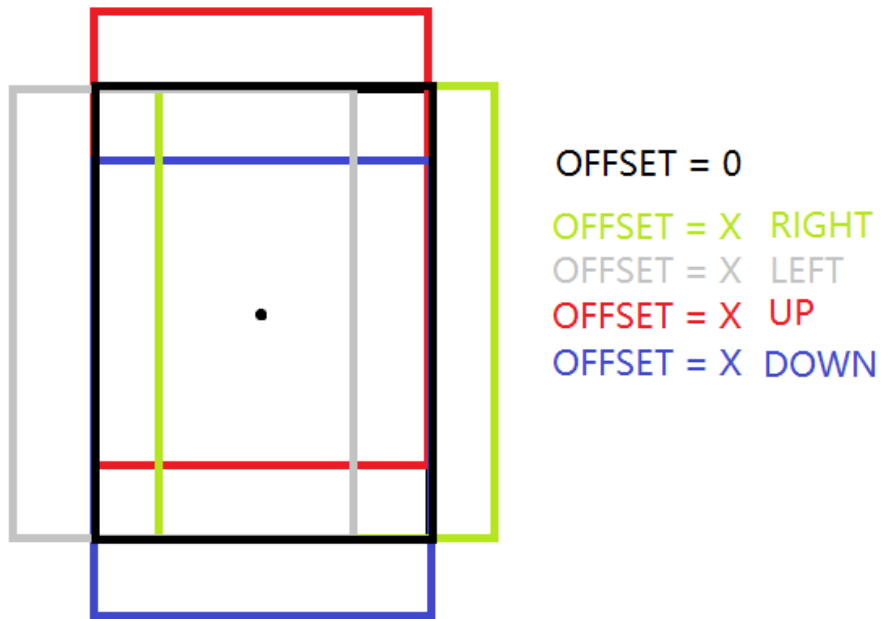

Send the command " VCMD=LFH".

If it return "Done" it means that you success.

(Notes: you can use command "CENT" to change the center point of POI if needed)

Step4:

Change offset to get your ideal area.

OFFSET = 0

OFFSET = X RIGHT

OFFSET = X LEFT

OFFSET = X UP

OFFSET = X DOWN

3.2. Pin Definition

From Left to Right		
Pin_1	USB_5V	
Pin_2	USB_GND	
Pin_3	USB_D-	
Pin_4	USB_D+	
Pin_5	HUART_TX	
Pin_6	HUART_RX	
Pin_7	UART_TX	
Pin_8	UART_RX	

3.3. Additional explanation

| Temperature related specifications and description		
Accuracy	±1℃	-30~45°C target temperature range, 25°C ambient temperature, 90% humidity environment test calibration @0.75m.
Homogenization	0.3℃	Center and edge temperature uniformity correction, the correction conditions refer to the above.
FPS (Frame per sec.)	7FPS	Normal operation 5~7 fps raw temperature data output
Filter	default	Data Filter and algorithm planted inside helping to achieve better effect for different applications, such as human body temperature screening.
UART/HUART Frequency	115200Hz	Support High-Speed UART interface, temperature data UART printing
USB	UVC	USB Video Class data is default. Also, this port can push out all the temperature data via especial protocol. (if needed please contact us for FAE).
API	UART CMD List	The highest temperature, lowest temperature, standard temperature, target point temperature output in the picture can be adjusted according to the application scene

3.4. Demonstration

Open **AMCAP.exe** in PC and you can see the image on screen. The right-upper corner of the screen will display the centum temperature. This data is updated with real time, depending on the frame rate. The thermal imaging color palette has modes to choose for different applications. The default palette is red and green schemes to highlight the difference between background and target.
4. Application Notes

When Hestia is used for Human body temperature detecting, it should be kept in mind that the target temperature is different from the core temperature. Quote the standard healthy people's surface temperature in different situations.

Skin Location	Cold (15°C)	Room (27°C)	Hot (47°C)
Forehead (A)	31.7	35.2	37
Back of Neck (B)	31.2	35.1	36.1
Chest (C)	30.1	34.4	35.8
Upper Back (D)	30.7	34.4	36.3
Lower Back (E)	29.2	33.7	36.6
Upper Abdomen (F)	29.0	33.8	35.7
Lower Abdomen (G)	29.2	34.8	36.2
Tricep (H)	28.0	33.2	36.6
Forearm (J)	26.9	34.0	37.0
Hand (L)	23.7	33.8	36.7
Hip (M)	26.5	32.2	36.8
Side thigh (N)	27.3	33.0	36.5
Front Thigh (O)	29.4	33.7	36.7
Back Thigh (P)	25.5	32.2	36.0
Calf (Q)	25.1	31.6	35.9
Foot (R)	23.2	30.4	36.2

To judge if target person is under common temperature or unusual situation, we suggest comparing the target area temperature with the common/average standard. Once the difference above 1℃, it can be briefly judge as an emergency.

Under 25℃ condition, the forehead should be around 35.2℃, and under lower ambient temperature the forehead temperature should be even lower. It's assumed that the costumer shouldn't use the forehead temperature compare to 36.3℃ to judge if temperature is correct.

5. Reversion History

V1.0   Initial release
V1.1   Corrected data display format and detailed CMD command operation
V1.2   Reduce the amount of date in DAT model and added CFT model.
V1.21   Add mechanical details and restructure the documents.
V1.22   Add TTT/JJJ model and add OPW model
V1.23   Add GYF model and R/C model
V1.24   Add LFH model and FHT model
V1.25   Add IRX model, OHT model, BDHC/BDLC model
V1.26   Add BDWH model, DTB model, and OFFS model
V1.27   Add CENT model
