Chlorination and Flushing

Your system has tested positive for Coliform bacteria but negative for E. Coli bacteria. Because of the positive test New Hampshire Department of Environmental Services requires your system to be chlorinated. **We will be chlorinating your system on Monday November 16, 2020.** We apologize for the inconvenience and appreciate your help in keeping your system clean, safe and reliable.

We do not recommend using water for drinking, cooking or laundry during chlorination.

We will introduce chlorine into the well and distribution system. We ask for your cooperation by running the cold water at each faucet until chlorine odor is present. **Once the odor of chlorine is detected, stop flushing the water and allow it to sit in the pipes overnight with minimal water use.** The following morning you may continue to flush the chlorine out of the water. This can be done from outside faucets to speed the process. The length of time the chlorine remains in the system will depend on the overall water usage in the community. The absence of chlorine in the system can be most easily determined when its characteristic odor is no longer detected. Until this time, the water may be discolored depending on the minerals in the water.

Thank You,
Craig McGraw & Harold Smith
