

VTA New Full Automation Control System for Vacuum Drainage

Why Install Full Automation with Vacuum Drainage Systems?

Vacuum drainage systems in large buildings is the future.

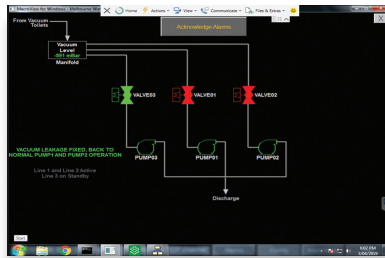

With our vacuum pan flushing at 0.5L/flush, you cannot do a better job of saving water. With gravity toilets, 90% of our precious fresh drinking water is flushed down the toilet. It's time for this to stop! Really! As buildings get larger, we see a need to automate a vacuum drainage system to make it easier to choose vacuum over gravity in your next project.

Here is why you should demand full automation of your vacuum drainage installation.

What are the Benefits of Full Automation?

Operated via a large touch screen (HMI) from which all of the below can be accomplished.

- Isolate drainage lines on individual floors for maintenance without affecting the building operation.
- Program maintenance schedules and look up operation procedures and manuals.
- Isolate vacant floors.
- Gain system function reports, power usage, run time.
- Isolate individual drainage risers.
- Monitor vacuum levels in piping network at selectable locations for performance information.
- Automatic fault location hunting and reporting.
- Remote monitoring operation/reporting via mobile phone.
- Remote network company/vendor support.
- Seamless Building Management System (BMS) interface.
- Operator and Supervisor level security.

We use a generic automation system easily serviced.

If you are serious about helping Australia save its precious water from being flushed down the toilet, and decide to go vacuum, then you should look at full automation for ease of operation and maintenance.

Vacuum Toilets Australia will not compromise on quality and functionality in our workmanship, product and design.
