RC Fueling Systems 5-Gallon Gasoline Fuel Container System

You just can't cobble together a portable gas-station fuel can and a cheap hardware-store hand pump and expect it to last. RC Fueling Systems is a great source for top-of-the-line equipment that's designed for RC modelers. With several sizes and types available, this 5-gallon gasoline fuel system comes complete and ready to use. Designed with safety and reliability in mind, it features a main power switch with a battery charge jack, and "On-Off-On" toggle switch for fueling and defueling, an internal pickup equipped with clunk filter tube, and a 90-day replacement warranty on all parts.

The 5-gallon container includes a 12V 2450mAh NiMH battery pack that's easy to charge and to check voltage through its JR-style charge jack. All the electrics have plugs and receptacles for easy replacement, and plug-and-play replacement parts are available. An optional feature is available in the form of a pump speed control that lets you dial in the fuel flow you want depending on the size fuel line your airplane is plumbed with.

I have been using the 5-gallon container system all summer and am the envy of most of my giant-scale RC flying buddies. It has worked flawlessly. Priced at \$139.95 (standard) and \$169.95 (with speed control), I highly recommend it. Also available for gasoline, kerosene, and smoke oil; in 2- and 1-gallon sizes; and with manual and electric pumps, there's certainly something to fill everyone's need.—Gerry Yarrish
